It consists essentially of an open basin, and two closed reservoirs at different levels below the basin. A tube connects the upper parts of both the reservoirs. Another tube connects the bottom of the basin with the lower part of the lower reservoir. A detachable tube with a jet-nozzle at its upper end passes through the center of the basin and down into and very nearly to the bottom of the higher reservoir. The detachable tube being removed, the higher reservoir is partly filled with water through the opening; then the tube is replaced, and water poured into the basin. This water, running down into the lower reservoir, forces the air from the latter up into and increases the pressure in the higher reservoir, displacing the water therein and forcing it through the detachable tube in the form of a jet. This ejected water falls into the basin and thence passes to the lower reservoir, and thus the action continues till nearly all the water in the higher reservoir has been discharged through the jet.—**Steam-fountain**, a fountain in which the liquid is raised by the pressure of steam upon the surface in a reservoir.—**Syn.** 1 and 2. *Spring*, etc. See *well*.

4. In *math.*: (*a*) In *arith.*, a part, or a number of aliquot parts, of unity. Unity is regarded as divided into equal parts, and one or more of these parts as taken to constitute the fraction. The number of parts into which the unit is divided is termed the *denominator*, and the number of these parts taken the *numerator*. The denominator is commonly written below, and the numerator above, a horizontal or diagonal line: thus, $\frac{1}{2}$, $\frac{2}{3}$, $\frac{5}{8}$. Fractions written in this form are called *common* or *vulgar fractions*. (See *decimal*.) A *proper fraction* is one whose numerator is less than its denominator; an *improper fraction*, one whose numerator is greater than its denominator: as, $\frac{2}{3}$, $\frac{7}{4}$. A *simple fraction* expresses the ratio between two whole numbers: as, $\frac{2}{3}$; a *compound* or *complex fraction* expresses the ratio between fractions (or mixed numbers), or between a fraction (or mixed number) and a whole number: as,

$$\frac{\frac{1}{2}}{\frac{3}{4}}, \quad \frac{9\frac{1}{2}}{\frac{3}{4}}, \quad \frac{2\frac{1}{2}+\frac{1}{4}}{1+\frac{3}{4}}, \quad \frac{\frac{2}{3}}{7}.$$

Compound or complex fractions can always be reduced to simple fractions. A *compound fraction* is also defined as a fraction of a fraction. A fraction is said to be reduced to its lowest terms when the numerator and denominator contain no common factor.

The *fraction* which denotes the ratio of the map to the true area is sometimes termed the representative *fraction*.

When the slime is thus cleansed and distributed, the table is revolved on its supporting axles, and the contents are dumped into assorting-boxes beneath, from which the ore is taken to be submitted to other operations suited to its character. This operation of sorting is called *framing* or *ragging*, and there were formerly various modifications of the process in use in Cornwall, England, where, however, the simplest form of ore-dressing has been nearly superseded by improved methods and machinery. See *buddle*[2] and *percussion table*.

The specimen of the silver coin given in the cut weighs about 217 grains, and was worth about one third as much as the gold coin. Under various names, such as Minorites, Barefooted Friars, and Gray Friars, the order spread rapidly throughout Europe; among its members were Alexander of Hales, Duns Scotus, Roger Bacon, Occam, Popes Sixtus V. and Clement XIV, and other eminent men; and the order was long noted for its rivalry with the Dominicans. Differences early arose in regard to the severity of the rule, which culminated in the fifteenth century in the division of the order into two great classes, the Observantines or Observants and the Conventuals; the former follow a more rigorous, the latter a milder rule. Thus, a wheel the axis of which is fixed, or a roller which is compelled to roll on the ground without sliding or turning, has but one degree of freedom — that is, it can move only forward or back. If it can turn without sliding, or slide without turning, either in the direction of its rolling or in that of its axis, it has two degrees of freedom; if it is capable of all these motions, it has four degrees of freedom. If one end of it can rise above the surface of the ground, it has five; if both ends can leave the ground, it has six degrees of freedom and is perfectly free.— **Freedom of repeal**, a free, unconditional recall.

Freedom of the will. See *will*.=**Syn.** 1. *Freedom*, *Liberty*, *Independence*; scope, range, play, swing, latitude. The first three words are sometimes used as synonymous, but they are clearly distinguishable. *Freedom* is the most general in its application. *Liberty* is commonly used where reference is made to past or possible physical confinement or restriction: as, the prisoners were set at *liberty*. *Freedom* is used where emphasis is laid upon

large opportunity given for the exercise of one's powers: as, the *freedom* of country life; or where the previous or possible restriction has been or is legal or moral: as, the slave was given his *freedom*; he expressed his views with *freedom*. *Liberty* is more often public; *freedom*, personal and private. *Liberty* has more in mind protection from external constraint or from the aggressions of power; hence, in civil affairs, *liberty* is *freedom* as outlined and protected by law. *Independence* is more exact, expressing not only self-direction but exemption from control, and even lack of connection. There may be *liberty* without *independence*, as in the case of a self-governed colony, and there may be *independence* without *liberty*, as in the case of a despotic monarchy.

Ye winds, that wafted the Pilgrims to the land of promise, fan, in their children's hearts, the love of *freedom!* . . . Speak, speak, marble lips! teach us the love of *liberty* protected by law. *Everett*, Eulogy of Lafayette.

The distinguishing marks of a *freehold* [in England] were, (1) that it should last for life, . . . (2) that the duties or services should be free: that is, worthy the acceptance of a free man. To fulfil this latter condition, it was necessary that the services by which the land was held and by the non-performance of which it would be forfeited should be honourable (that is, not servile) in respect of their quality, and certain in respect both of their quality and quantity. *Mozley and Whitely*, Concise Law Dict.

(*b*) Hence, in general, an estate in land such as was originally considered as being an ownership of the soil itself, as distinguished from a mere use or chattel interest in it. That is, it is an estate in possession, either of indefinite future duration, transmissible to one's heirs (called an estate of inheritance), or for the life of either the owner or some one else; or "an estate in possession, the duration of which is not fixed or ascertained by a specified limit of time" (*Digby*).

See *freehold*, 1. Under various laws in England and the United States, the right of suffrage and the qualification for some minor local official duties or trusts have been conferred on freeholders as distinguished from other inhabitants. In Scotland the term is applied to one holding lands of the crown.—**Chosen freeholders**, in New Jersey, a board of county officers having charge of the finances of the county, corresponding to the *county commissioners* or the *board of supervisors* of other States.—**Freeholders' court.** Same as *court-baron.*

3. In *early Eng. hist.*, a ceorl; one admitted to a share in the land and corporate life of the village community.

The *freeman* [in Anglo-Saxon times] was strictly the freeholder, and the exercise of his full rights as a free member of the community to which he belonged became inseparable from the possession of his "holding" in it. It was this sharing in common land which marked off the *freeman* or ceorl from the unfree man or læt, the tiller of land which another owned.
J. R. Green, Making of Eng., p. 191.

freemartin (frē′mär′tin), *n.* A cow-calf twin-born with a bull-calf. It is generally barren, and when this is the case on dissection is found to have parts of the organs of each sex, but neither perfect.

freemason (frē′mā′sn), *n.* [Not found earlier than mod. E.; < *free* + *mason.*] A member of an order, fraternity, or brotherhood forming a secret society, or series of affiliated secret societies called lodges, now existing in all the countries of Europe, in many parts of America, and in other parts of the world where Europeans have settled in larger or smaller communities. This society is founded on and professes the practice of social and moral virtue; truth, charity in its most extended sense, brotherly love, and mutual assistance being inculcated in it. It possesses an elaborate ritual, numerous grades of officers, and many secret signs and passwords, by which members may make themselves known to other members of the craft in any part of the world. Secret organizations of free or enfranchised operative masons, with similar rituals, were formed in the middle ages, when skilled workmen moved from place to place to assist in building the magnificent sacred structures—cathedrals, abbeys, etc.—which had their origin in those times, and it was essential for them to have some signs by which, on coming to a strange place, they could be recognized as real craftsmen and not impostors. There was such a society of actual masons and builders in England in the seventeenth century, and some persons not belonging to the craft had been accepted as members of it; hence the full name of the present fraternity, "Free and Accepted Masons" (abbreviated *F. and A. M.*). Modern freemasonry dates from the organization in 1717 of the four lodges then existing in London, on a new basis, into a grand lodge, by which other grand lodges were chartered. To mark its departure from the limited scope of the original society, the principles and methods of the order are called *speculative masonry*, the terms and insignia of operative masonry being retained. Fable, though absolutely without any historical basis, takes the history of the order back to the Roman empire, to the Pharaohs, to the building of Solomon's temple or the tower of Babel, or even to the building of Noah's ark.

The Free soil party arose out of a coalition of the Liberty party with the Barnburners in 1848, and, with the addition of Whigs, Know-nothings, and some Democrats, became in 1854 the Republican party. It nominated candidates for the presidency in 1848 and 1852.

The absence of the wooden ornaments of the external porch, as well as our ignorance of the mode in which this temple was finished laterally, and the porch joined to the main temple, prevents us from judging what the effect of the front would have been if belonging to a *free-standing* building. *J. Fergusson*, Hist. Indian Arch., p. 121.

free-thinker (frē′thing′kėr), *n.* One who is not guided in the formation of his beliefs by obedience to authority, but submits the claims of authority to reason as the ultimate arbiter. The early application of the term was to those who occupied a rationalistic position in regard to current religious beliefs and dogmas; hence it acquired the still-current sense of skeptic, infidel, and even atheist. The word, though employed earlier, is generally supposed to have been brought into common use in 1713 by the publication of Anthony Collins's "A Discourse of Freethinking, occasioned by the Rise and Growth of a Sect called *Freethinkers*." Although this work defines *free-thinking* as the endeavor to judge a proposition according to the weight of evidence, and does not explicitly maintain any proposition which can offend a Protestant, it was rightly judged to be a covert attack upon fundamental tenets of the Christian religion. The free-thinkers specifically so called formed a class of deistical writers in England in the seventeenth and eighteenth centuries, the chief of whom were Toland (died 1722), Anthony Collins (1676–1720), Woolston (1669–1733), Tindal (died 1733), and Bolingbroke (1678–1751). See *deist*.

The idiot is supposed to say in his heart what David's fool did some thousands of years ago, and was therefore designed as a proper representative of those among us who are called atheists and infidels by others, and *free-thinkers* by themselves. *Addison*, Religions in Waxwork.

Is he a churchman? then he's fond of power:
A quaker? sly: a presbyterian? sour:
A smart *free-thinker*? all things in an hour.
Pope, Moral Essays, i. 157.

The *freethinker* perhaps too has imbibed his principles from the persons among whom he was bred up. *A. Tucker*, Light of Nature, V. viii.

Who born within the last forty years has read a word of Collins and Toland and Tindal and that whole race who called themselves *freethinkers*? *Burke*, Rev. in France.

If Collins included as *freethinkers* all who differed from the prevalent creed of the time, Bentley would not deny that *freethinkers* had done good service. If, on the other hand, Collins meant, as Bentley assumed him to insinuate, that all these *freethinkers* were atheists, then he was palpably wrong. *Leslie Stephen*, Eng. Thought, iv. § 14.

= Syn. *Unbeliever*, *Skeptic*, etc. See *infidel*.

free-thinking (frē′thing′king), *n.* The act or the habit of inquiring freely into the truth of a fact or point of faith in which authority requires implicit belief: especially applied to skeptical inquiry into the supernatural elements of Christianity.

Collins's Discourse on *Freethinking* discusses the relation of reason to the acceptance and the interpretation of revelation, with great acuteness and ability, in a spirit not favorable to much of the current theology of the time. *N. Porter*, App. to Ueberweg's Hist. Philos., p. 376.

freezing-mixture (frē'zing-miks'tūr), *n.* A mixture that has the property of producing a sufficient degree of cold—that is, a sufficiently rapid absorption of heat—to freeze liquids. In general, such a mixture consists of a solid and a liquid in which the solid rapidly dissolves: for example, hydrochloric acid and sodium sulphate. Its effect is due to the fact that the change of a solid to a liquid requires a certain amount of heat (see *latent heat*, under *heat*), and if this change goes on rapidly, a considerable lowering of temperature results. In the common case of pounded ice and salt, which gives a temperature of about 0° F. (- 18° C.), there is a double change, both resulting in the absorption of heat—the melting of the ice and the solution of the salt. See *ice-machine*.

freezing-point (frē'zing-point), *n.* The temperature at which a liquid freezes; loosely, the temperature at which ice melts. The freezing-point, in the strict sense, depends on many circumstances difficult to control, and many liquids, including water, can with care be cooled several degrees below their melting-points without freezing. The melting-point of ice (water), however, is relatively fixed and readily observed. Consequently, the melting-point is always substituted for the freezing-point in making thermometers, although it is generally called by the latter name.

The *freezing-point* of water and the melting-point of ice, as Professor Tyndall remarks, touch each other as it were. *J. Croll*, Climate and Time, p. 557.

II. *n.* 1. The language spoken by the people of France. French is parallel with Provençal, Spanish, Portuguese, Italian, Wallachian, and minor dialects, called together the *Romance languages*, being descended from the Latin as spoken by the Romans and the peoples of the various provinces whom they brought under their dominion, mingled with the Celtic and Teutonic tongues with which Latin was thus brought in contact. (See *Romance.*) *French* means 'the language of the Franks,' a Teutonic people merged with the mixed races of Gaul, who received the Frankish name (the country being thence called *France*), but retained their Romanic speech, the Franks and other Teutonic tribes, and later the Northmen, accepting the speech of the people they conquered. It is divided chronologically into *Old French* and *modern French*, the former extending from the ninth century to the fourteenth, or, with the convenient inclusion (as usually in this dictionary) of what is specifically called *Middle French*, to the sixteenth century. Old French existed in many dialects, the phrase, indeed, when unqualified or undiscriminated, including the aggregate of such dialects. The most important were the dialect of the Île de France, which, as the "French of Paris," has become the modern literary French; and that of Normandy, the *Norman* or *Norman French*, which, transferred to England at the Conquest and there developed (as Anglo-French), gave much to and took much from the English, and was finally displaced by the mixed English speech thus formed. (See *English.*) By later borrowing from French, or from the Latin on the French model, the Romanic part of the English vocabulary is now to a great extent nearly identical with that of French. As the most central and highly developed of the Romance dialects, French began, in the sixteenth and seventeenth centuries, to take the place of Latin as the general language of diplomacy, polite society, and commerce. Its importance in this respect has much diminished in the present century. It is now drawn upon by other languages chiefly for terms of fine art, dress, and cookery. The use of accents as a customary part of French orthography began in the seventeenth century; they now form a rigid artificial system, often a guide to pronunciation, and reflecting generally, but with numerous exceptions, previous etymological conditions of the words concerned. Regarded as a Romance language, French is remarkable for its departure from the Latin type. In its vowel and consonant system (notably in its nasal vowels), its sweeping contractions, and its general destruction of final sounds or syllables, with the retention in many cases of these lost sounds in spelling, it differs markedly from other Romance tongues.

2. A method of painting on walls covered with a ground or coat of plaster or mortar, with which the colors become permanently incorporated if properly chosen and applied; also, a picture or design so painted. *True fresco* (Italian *buon fresco*) is painting in colors mixed with water or hydrate of lime upon a wet surface of mortar made of lime and pure quartz-sand. In this method earth pigments are chiefly used, because all vegetable and many mineral pigments are decomposed by lime or altered by light. The solidity of the painting depends upon the penetration of the colors into the plaster or mortar, and upon the crystalline layer which forms upon its surface before the mortar has set, as it does in a few hours through the absorption of carbonic acid from the atmosphere. If this crystalline layer is disturbed, or if it has begun to form while the artist is painting, or if it forms between the thinner and thicker coats of color successively applied, the colors will flake and fall away. *Dry fresco* (Italian *fresco secco*) is a method of fresco-painting upon a dry surface. The last coat of plaster, or intonaco, when perfectly dry, is rubbed with pumice-stone, and well wetted with water and a little lime the evening before painting, and again immediately before the artist begins work. The first step in this process is to pounce the outline of the design upon the wall. The phrase *fresco secco* is applied also to retouching in distemper. The implements used by fresco-painters include wooden and glass floats, trowels of wood and iron, palette-knives of steel and bone, a trimming-knife, a bone or ivory stylus, and brushes of hog-bristles and other hair, of such quality as to be neither curled nor burned by lime. Compare *distemper*[2].

It is a very common error to term the ancient paintings found on church walls, &c., *frescos*, but there is scarcely an instance of a genuine *fresco* among them. They are distemper paintings on plaster, and quite distinct in their style, durability, and mode of manipulation. *Fairholt*.

Cowper, Mischievous Bull.

2. In *mech.,* the resistance to the relative motion, sliding or rolling, of surfaces of bodies in contact: called in the former case *sliding,* in the latter *rolling friction.* It is partly due to the adhesion of bodies, but the greater part of it is the result of their roughness The friction proper is independent of the velocity and of the area of contact; it depends solely upon the nature of the two surfaces and upon the pressure upon them, to which it is directly proportional What is sometimes called the *internal friction* of fluids is *viscosity* (which see). The friction of a fluid upon a solid is considerable; it is now recognized as an important factor in the designing of ships.

3. Figuratively, lack of harmony; mutual irritation; worrying; difficulty.

friction-breccia (frik'shon-brech"iä), *n.* In *geol.*, angular or sometimes imperfectly rounded fragments of rock filling more or less completely the cavity left between the sides or walls of a fault or fissure. This material may have been torn from the walls as one of the results of the violent motion to which the rock was subjected at the time the fissure originated, or it may have fallen in from above after the cavity had been formed. Mineral veins are not infrequently made up in considerable part of brecciated material derived from the rubbing together and crushing of the adjacent rock. Large masses of rock thus occurring in a vein are called *horses*. Friction-breccia is also sometimes called *fault rock*. See *vein* and *horse*.

friction-cones (frik'shon-kōnz), *n. pl.* In *mach.*, a form of friction-coupling consisting of two cones, one of which is fitted into the other and communicates its motion to it by means of the friction between the two surfaces. See *friction-coupling*.

Friction cones.
a and *b*, cones; *c*, fork.

friction-coupling (frik'shon-kup"ling), *n.* In *mach.*, a device for conveying motion from one line of shafting to another by the frictional contact of cones, expanding toggles, and clutches of various forms. In all these appliances a sleeve sliding on one of the shafts and turning with it may be advanced or drawn back at will to bring the parts into action. In the friction-cone coupling a conical disk is pushed at will into a hollow cone, the two surfaces fitting closely together, and either, when in motion, imparting its motion to the other by friction. In other friction couplings the sliding sleeve causes a pair of toggles to expand against the inner rim of an idle pulley, and by their contact to impart to it their motion; or the movement of sliding levers over a cone causes two pulleys to be drawn together into frictional contact, or causes two disks to press one against the other. In all these couplings the object sought is to connect parts of a line of shafting by frictional contact instead of direct contact, as in a geared wheel, and to obtain the same advantages in a coupling that are found in friction gearing.

Friction-coupling.

friction-gear (frik'shon-gēr), *n.* Same as *friction-gearing*.

friction-gearing (frik'shon-gēr"ing), *n.* A method or system of imparting the motion of one wheel or pulley to another by simple contact. The advantages of this kind of gearing are threefold: it enables the parts of a machine to be thrown quickly into or out of play; it gives a variable speed or power; and it prevents the injury caused by a breakage or stoppage from extending from one part of the mechanism to another or from the machine to the motor. The most simple form of friction gearing is a pair of wheels with thin faces, which may be covered with leather, a fabric, or other elastic material, in more or less close contact. In some such wheels the faces are grooved, or the wheels are cone-shaped and placed at a right angle and with grooves cut on the faces. In others a collar on a shaft may carry pivoted arms which if turned one way press against the inner face of a wheel, and if turned the other way fall back out of contact and cease to impart their motion. In other forms one wheel revolves within another, contact being assured by means of springs. If the resistance overcomes the springs the contact is destroyed and motion is no longer imparted. Variable speed and reversal of direction are also secured by causing a friction-wheel placed at right angles with a disk and against it to move from the rim toward the center or past the center of the disk, as in the feed-motion of some forms of gang-saws.

Friction-gearing, grooved.

frictionless (frik'shon-les), *a.* [< *friction* + *-less*.] Without friction.

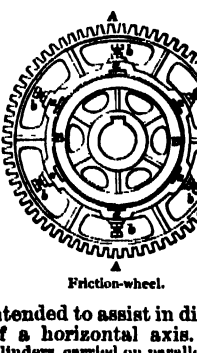
> Were water absolutely *frictionless*, an incline, however small, would be sufficient to produce a surface-flow from the equator to the poles.
> *J. Croll*, Climate and Time, p. 220.

> The joints and bearings of all the levers are made *frictionless* by using flexible steel connecting plates instead of knife-edges.
> *Encyc. Brit.*, XXII. 597.

friction-match (frik'shon-mach), *n.* A match tipped with a compound which ignites by friction: the usual form of match in domestic use. The first chemical matches were invented in Paris in 1805; and soon after 1827, when the composition of friction-matches was much improved by an English chemist, they came into general use, superseding the various applications of the flint and steel which had until then been relied on.

friction-plate (frik'shon-plāt), *n.* 1. A metal plate attached to any surface to prevent abrasion or resist friction.—2. A plate used in connection with a clamp to check the recoil of a gun-carriage.

friction-powder (frik'shon-pou"dėr), *n.* A composition of chlorate of potash and antimony, which readily ignites by friction.



friction-primer (frik'shon-prī"mėr), *n.* A friction-tube. [U. S.]

friction-sound (frik'shon-sound), *n.* In *pathol.*, the sound perceived on auscultation of serous surfaces which rub together when through disease they are roughened or not well lubricated.

friction-tight (frik'shon-tīt), *a.* In *mach.*, fitting so tightly or closely that a desired effect of friction is produced. Noting—(*a*) A mechanical fit, joint, or union between the surfaces of two assembled parts so close that any motion given to one part will be transmitted to the other without slipping, as a contact between two curved surfaces so perfect that their reciprocal pressure is sufficient to transmit any motion of rotation applied to one to the other without the interposition of any locking device, as a key, gib, splice, screw-thread, set-screw, or polygonal surface. (*b*) A close fit produced by a pressure sufficient to retain a part in its position when acted upon by its weight alone.

friction-tube (frik'shon-tūb), *n.* *Milit.*, a tube used in firing cannon, sufficient heat being generated in it by friction to ignite friction-powder. [Eng.] Called *friction-primer* in the United States service.

friction-wheel (frik'shon-hwēl), *n.* In *mach.*: (*a*) A form of slip-coupling applied in cases where the variations of load are sudden and great, as in dredging-machinery, etc. In the form illustrated a strong pulley, *B*, is keyed on the driving-shaft, and on the circumference of this a wheel, *A*, is fitted, with a series of friction-plates, *a*, *a*, *a*, interposed, and retained in recesses formed in the eye of the wheel. Behind each of these plates a set-screw, *b*, is inserted, which bears against the back of the plate, and can be tightened at pleasure to regulate the degree of friction required for the ordinary work; but should the pressure on the circumference of the wheel *A* exceed this, the plates slide upon the circumference of the pulley *B*, which continues to revolve with the shaft, and the wheel itself remains stationary. (*b*) One of two simple wheels or cylinders intended to assist in diminishing the friction of a horizontal axis. The wheels are simply plain cylinders, carried on parallel and independent axes. They are disposed so as to overlap pair and pair at each end of the main axis, which rests in the angles thus formed by the circumferences. The axis, instead of sliding on a fixed surface, as in ordinary cases, carries around the circumferences of the wheels on which it is supported with the same velocity as it possesses itself, and in consequence the friction of the system is proportionally lessened.

Friction-wheel.

> A late improvement in what are called *friction-wheels* . . . consists of a mechanism so ordered as to be regularly dropping oil into a box which encloses the axis, the nave, and certain balls upon which the nave revolves.

The name *Frigg* appears in Icel. only as the name of a goddess, the wife of Odin, different from *Freyja*; in AS. from the same root as *free*, *friend*, *frith*[1], etc.; cf. Skt. *priyā*, f., one beloved: see *free*, *friend*, *frith*[1].] The sixth day of the week. Friday is the Mohammedan sabbath or "day of assembly." It is said in the Mohammedan traditions to have been established by divine command as a day of worship for Jew and Christian alike, as being the day on which Adam was created and received into Paradise, the day on which he was expelled from it, the day on which he repented, and the day on which he died. It will, according to the same traditions, be the day of the resurrection. In the Roman and Eastern and Anglican churches, all Fridays except Christmas day (when it occurs on Friday) are generally observed as fasts of obligation or days of abstinence, in memory of the crucifixion of Christ, an event which is more especially commemorated annually on Good Friday (see below). In most Christian nations Friday is popularly regarded with superstition, and is considered an unlucky day for beginning any enterprise, to spill more or less salt on Friday is considered an especially bad omen. Until recently it was common for criminals under sentence of capital punishment to be executed on Friday; hence Friday is sometimes called *hangman's day*.

(*b*) Any Friday marked by a great calamity: with special reference in England to Friday, December 6th, 1745, the day on which news reached London that the young pretender Charles Edward had reached Derby; or to the commercial panic caused by the failure of the house of Overend and Gurney, May 11th, 1866; and in the United States to the sudden financial panic and ruin caused by reckless speculation in gold on the exchange in the city of New York on Friday, September 24th, 1869; or to another similar panic there, which began September 18th, 1873.—**Golden Friday.** (*a*) The Friday in each of the ember-weeks. *F. Good Friday, the Friday before Easter, a holy day of the Christian church, in memory of Christ's crucifixion, of which this day is taken as the anniversary. The early church observed it as a strict fast; in the church services doxologies were omitted, no music except the most plaintive was allowed, and the altars were stripped and draped in black. At present, in the Greek and Roman Catholic churches, Good Friday is a solemn fast; and it is also observed with special services and prayers by the Church of England, and the Protestant Episcopal Church in the United States, and by the Lutherans, German Reformed Church, Moravians, and many Methodists.

Alien friend, a foreigner whose country is at peace with one's own.—**Friends of God**, a name assumed by an unorganized brotherhood of German mystics existing in the fourteenth century, who, in opposition to the formalism and ecclesiasticism of their age, emphasized the possibility and duty of complete self-renunciation and intimate spiritual union with God. Prominent among the leaders were Nicholas of Basel and John Tauler. As they were not bound together by either an ecclesiastical organization or a common creed, their views of religious truth differed, and some of their utterances gave rise to charges of pantheism and antinomianism.—**Friends of Light, Protestant Friends**. A division occurred in portions of the society in America in 1827, through the preaching of Elias Hicks, whose followers, commonly called *Hicksites*, hold doctrinal views closely approximating those of the Unitarians, while in church government and other respects they retain the usages of the orthodox Friends. The latter agree doctrinally with other evangelical Christians, but lay greater stress on the doctrine of the personal presence and guidance of the Holy Spirit. They have no paid ministry, and accept the ordinances of baptism and the Lord's supper in a spiritual sense only, rejecting their outward observance as church rites. They condemn all oath-taking and all war. The organization of the Society involves four periodical gatherings called "meetings": namely, preparative meeting, monthly meeting, quarterly meeting, and yearly meeting. The body called the Yearly Meeting has supreme legislative power. There are two Yearly Meetings in Great Britain, one in Canada, and thirteen in the United States.—**To be friends with**, to be in a relation of mutual or reciprocal friendship with.

The proper AS. form is **frithborh*, < *frith*, peace, + *borh*, a pledge (> E. *borrow*[1], *n.*). Cf. *frithsoken* and *frank-pledge*.] In *Anglo-Saxon law*, one of the tithings or groups of ten men into which the hundred was divided, the members of each one being held liable for the misdeeds of a fellow-member.

In *Anglo-Saxon law*, the franchise or governmental power of requiring the people to keep the peace; the jurisdiction to punish for breaches of the peace. (See *soc*.) The Normans, it is supposed, by confusing the Anglo-Saxon *frith* with *fre*, *fri*, modern *free*, adopted the term *frank-pledge* to designate the binding of persons to be peculiarly responsible for one another's peaceable conduct.

Fuller, Church Hist., II. v. 9.

Such a privilege [the right of sanctuary or refuge for criminals] was given by allowing what was called the *Frithstool* to be set up in some part of the hallowed building. This "stool of peace," for such is the meaning of the word, was a low backed arm-chair, made of stone. Its standing-place was either near the high altar, or by the side of the patron saint's shrine. From this spot, as from a center, the *frithstool* spread its privilege of sanctuary over land and water all about the minster which held it, to the distance of at least a mile

Dan. *frø*, a frog; Icel. *fraukr*, a frog; the origin is unknown.] A batrachian of the family *Ranidæ* (which see), as the common British *Rana temporaria*, or its North American representative, *R. sylvatica*. Of the true frogs there are about 250 species, belonging to 18 genera, common in most parts of the world except the Neotropical and Australogæan regions, including for the most part aquatic or arboreal batrachians, distinguished by their agility and symmetry, as well as by their webbed toes, from the related batrachians which are popularly named *toads*; but the distinction is not always preserved. Of the genus *Rana* alone there are upward of 110 species, most of which are aquatic, are expert swimmers, and capable of making very long leaps, some are terrestrial, and some arboreal. Several different kinds of frogs are edible, as the common European *R. esculenta*. The largest species is the bullfrog of the United States, *R. catesbiana*. (See *bullfrog*, and cuts under *Anura* and *Rana*.) Others of the same country are *R. palustris*, *R. halecina*, and *R. clamata*. The toes of some arboreal frogs are enormously lengthened and fully webbed, enabling the creatures to make long flying leaps. (See *flying-frog*, *Rhacophorus*.) Some have the ends of the toes dilated, like many of the toads. The tongue of most true frogs is emarginate behind, with a process on each side. Most frogs deposit their spawn in masses in the water, and the young hatch from the egg as tadpoles, provided with a tail and external gills, which disappear with the growth of the permanent limbs. The arboreal batrachians known indifferently as *tree-frogs* or *tree-toads* are not frogs in any proper sense, but belong to a different suborder (*Arciferæ*) of salient amphibians. (See *Hylidæ*.) The name *frog* is loosely applied, with or without a qualifying term, to some other batrachians equally remote from the *Ranidæ*, and locally in the United States to certain lizards. fugue (fūg), *n.* [F., < It. *fuga*, also *fugga*, a flight, a fugue, < L. *fuga*, a flight, < *fugere*, flee: see *fugitive*.] In *music*, a polyphonic composition based upon one, two, or even more themes, which are enunciated by the several voices or parts in turn, subjected to various kinds of contrapuntal treatment, and gradually built up into a complex form having somewhat distinct divisions or stages of development and a marked climax at the end. The most general divisions of a fugue are the exposition, the development, and the conclusion. A *strict fugue* is one in which each division is developed symmetrically and in a purely contrapuntal manner; while a *free fugue* is one that is irregular or incomplete in plan or detail. (*a*) In the *exposition*, the first voice enunciates the theme alone (subject, dux, antecedent) in the tonic key; the second voice then enunciates it (answer, comes, consequent) in the dominant key, sometimes with slight alterations; the third voice then imitates the first at the octave (usually); the fourth voice imitates the second in the same way; and so on, until all the voices, if there are more than four, have entered with the theme. The earlier voices usually accompany the later ones as they enter; and the melody added by the first voice to the answer in the second is often contrived in double counterpoint with it, so as to serve throughout the fugue as a counter-subject or foil for the original theme. The character of the theme gives the name to the fugue; a *diatonic fugue* having a diatonic subject, a *chromatic fugue* a chromatic subject, a *Doric fugue* a subject in the Doric mode, etc.: the character of the subject generally determines the character of the development. A *real fugue* is one in which the answer imitates the subject, note for note, usually at the fifth or fourth, while a *tonal fugue* is one in which the answer contains such slight alterations of the subject as shall adjust it exactly to its different tonality. A *fugue by inversion* is one whose answer is the inversion of the subject; so *fugue by augmentation*, *by diminution*, *at the sixth*, etc. The order in which the voices shall enter, and the exact relations of the answer to the subject, are both regulated by rules. A *double fugue* has two subjects, a *triple fugue* three subjects, etc. A *fugue in two parts* is one for two voices only, etc. A free part is sometimes added to those essential to the contrapuntal development of the fugue. (*b*) In the *development*, the subjects, answers, and counter subjects are used repeatedly, either wholly or in part, in different keys, under varying treatment, so as to unfold their entire contrapuntal capacity. The successive sections should have an increasing contrapuntal interest and intricacy, and should be closely bound together; though episodes or diversions from the orderly treatment of the principal themes may be inserted between the sections for contrast. (*c*) In the *conclusion*, the theme is

usually presented by all the voices in turn, as in the exposition, but frequently so rapidly that the entries overlap. Such an overlapping section is called the *stretto*. In connection with this, and usually as the final section, a pedal point is often introduced. The fugue is the consummate form of the polyphonic style of composition, requiring for its successful production a mastery of all the devices of counterpoint, as well as a very high grade of inventive and constructive genius. The greatest writers of fugues are J. S. Bach (1685–1750) and G. F. Handel (1685–1759)

They are remarkable for the prolongation of the forehead into an empty vesicular expansion, and are so named because it has been asserted that the lantern-fly proper (*F. lanternaria*), a native of Guiana, emits a strong light from this inflated projection. The evidence of this luminosity, however, is more than doubtful. A Chinese species has, on equally equivocal testimony, been called *F. candelaria*. See *lantern-fly*.

Fulgorida (ful-gor'i-dą), *n. pl.* [NL., < *Fulgora* + *-ida*.] The lantern-flies proper; the *Fulgoridæ* in a restricted sense, or a subfamily of *Fulgoridæ* in a broad sense.

See the extract, in which the family is characterized in a large sense.

The family *Fulgoridæ* is distinguished by the presence of the great lantern-flies, and includes also a host of other species of very diverse forms and of many varieties of structure. It contains forms which might have been mistaken for butterflies and moths, and others which closely

imitate . . . genera of Neuroptera. . . . They may be recognised by the compressed, vertical, often carinated face, and by the bristle-shaped antennæ being set into a button-shaped base on the sides of the cheeks beneath the round eyes, and below which latter a small ocellus appears. The wing-covers are generally opaque, and narrower than the wings. . . . The family is now divided into thirteen subfamilies. *Stand. Nat. Hist.*, II. 229.

Pg. *fulgurar*), lighten, flash, < *fulgur*, flashing, lightning, < *fulgere*, flash, lighten: see *fulgent*.] To flash as lightning: as, *fulgurating* clouds.

The species are mostly of large size, and are characteristic of the eastern and southern coasts of the United States. They have a pear-shaped shell with a long anterior canal and a single fold around the base of the columella. The most common species are *Fulgur carica* and *Sycotypus canaliculatus*.

fulgurite (ful′gū-rīt), *n.* [< L. *fulgur*, lightning, + *-ite*[2].] A tube formed, usually in loose sand, but sometimes in the solid rock, by lightning; a lightning-tube. Fulgurites are the result of the passage of the electric current through the soil, sand, or rock, producing more or less complete fusion in the vicinity of the path traversed. They usually descend vertically, but sometimes obliquely, and they occasionally branch toward the bottom. They are rarely more than one or two inches in diameter. The effect of lightning is sometimes seen, and occasionally on a large scale, where no proper fulgurites have been formed, but rather a sort of honeycombed condition of the rock, resembling that produced in wood by the boring of the teredo, as observed on Little Ararat, and described by Abich. For the rock (andesite) thus vitrified and altered this geologist proposes the name *fulgurite andesite*.

fulgurous (ful′gū-rus), *a.* [< L. *fulgur*, lightning, + *-ous*.] Lightning-like; appearing or acting like lightning.

There are about 10 species, of most parts of the world. The common European coot is *Fulica atra*; that of the United States is *F. americana*. (See *coot*.) upper mandible. It inhabits the northern seas in prodigious numbers, breeding in Iceland, Greenland, Spitzbergen, the Shetland and Orkney islands, the Hebrides, etc. It feeds on fish, the blubber of whales, and any fat, putrid, floating substance that comes in its way. 6. In *math.*, a mathematical quantity whose value depends upon the values of other quantities, called the arguments or independent variables of the function; a mathematical quantity whose changes of value depend on those of other quantities called its variables. Thus, if the diameter of a circle be conceived to vary in length, the length of the circumference will also vary with it, in accordance with a fixed geometrical law, and is therefore a function of the diameter, the latter being regarded as the independent variable. So in the equation $y = ax + b$, if x be conceived to vary independently, y will be its function, since its value will vary with each successive value of x. The common algebraic notation is $y = f(x)$, to be read "y is a function of x." F, ϕ, and other letters are often used in place of f. It is not the special value of fx, but this quantity considered as variable and as depending upon x, which is called the *function* It is even called the same *function* irrespective of the special values of certain parameters upon which it may depend, and which are considered not as variables, but as constants. The earlier analysts used *function* to mean merely a power, or continued product of a quantity into itself. The present mathematical meaning first appears in the Latin correspondence between Leibnitz and John Bernoulli. Mathematical usage is not precisely settled as to the meaning, and this in two respects. First, as some writers use the word, the possible values of the function depend upon the values of the variables; so that, if y is a function of x, there must be some value which y can take for some value of x, which it cannot take for some other value of x. But other writers hold that two quantities which are functions of a third are functions of each other. For example, if $x = \tan t$ and $y = \tan(t\sqrt{2}) + i\tan(t\sqrt{3})$, they hold that y is a function of x, although it can take every value for every value of x; for there is even here a connection between the values of x and y, so that in the course of any continuous change of x the mode of change of y is somewhat restricted. Secondly, according to the usage of Cauchy and his followers, if an imaginary quantity, $X + Yi$, be so connected with another, $x + yi$, that X and Y are each of them functions of x and y, say $X = F(x, y)$ and $Y = f(x, y)$, then the former imaginary is a function of the other; but the majority of mathematicians have restricted the name *function* to what the school of Cauchy would term monogenous and differentiable functions, although such a restriction is impossible where the variable does not vary continuously The tendency of recent writers is to give the greatest possible breadth to the application of the term.

For example, suppose that $y = 0$ when x is irrational, while $y = (-1)^p q$ when x is equal to the irreducible fraction p/q. Then, although y never becomes infinite, yet between any two assignable values of x it has values greater than any predesignate positive number, and values less than any predesignate negative number.—**Vector function,** a quantity of the nature of a vector, having magnitude and direction, distributed through space so as to have a definite magnitude and direction at each point.—**Velocity function,** in *hydrodynamics,* a scalar function whose partial differential coefficient for a linear displacement of the variable point is equal to the component velocity of the fluid in that direction at that point.—**Vital functions,** functions immediately necessary to life, as those of the brain, heart, and lungs.—**Weierstrassian function.** See *Weierstrassian.*—**X_n function,** a Legendrian polynomial of the *n*th order, or function of the latitude and longitude on a sphere, satisfying Laplace's equation.—**Y_n function,** the Laplace's *n*th coefficient, being what P_n becomes when for the variable x we substitute $x = \cos\theta\cos\theta_1 + \sin\theta\sin\theta_1\cos(\phi - \phi_1)$.—**Zeta function.** See *zeta.*

2. To convert (a floating debt) into capital or stock, or into a more or less permanent debt, represented by bonds for definite sums, bearing interest at a fixed rate, and commonly redeemable within a fixed period of years. That part of the indebtedness of a government or corporation which is payable immediately or soon, so that early provision for payment must be made or forbearance obtained, is called the *floating debt*. To *fund* such an indebtedness is to cancel it by inducing the creditor to take in its place obligations having considerable time to run, and issued, in convenient portions or shares, in the form of interest-bearing bonds or certificates available to the holder as marketable securities; or by procuring a fresh loan on the issue of such obligations, and using the proceeds to pay off the floating indebtedness. To *refund* a debt is to repeat this process when the time obtained by the funding expires. The *funded debt* of a body politic or corporate is the aggregate of the debt thus provided for. It is approximately the same in amount as the old debt, unless it is increased, as is often the case, by including in it the expenses of funding, or by issuing the obligations below par. The funded debts of governments are spoken of as the *public funds*, and the securities issued are spoken of as *stocks* or *bonds*. Such securities, when issued by corporations, are usually spoken of in the United States as *bonds* (the word *stocks* being applied to shares, which do not represent the debt of a corporation, but ownership in it), and in Great Britain as *bonds* or *debentures*. With the funding of a debt is frequently coupled the creation of a sinking-fund for its redemption. See *sinking-fund*, under *fund*[1], *n.*

It is usually called the *Chinese phenix*, but seems, from the descriptions of it found in books, to resemble the Argus pheasant. It has not appeared since the days of Confucius. It is frequently represented on Chinese and Japanese porcelains and other works of art. *Fung* is the name of the male bird, and *hwang* of the female.

The *fung hwang* of Chinese legends is a sort of pheasant, adorned with every color, and combining in its form and motions whatever is elegant and graceful, as well as possessing such a benevolent disposition that it will not peck or injure living insects, nor tread on growing herbs.
S. W. Williams, Middle Kingdom, I. 266.

Fungi (fun′ji), *n. pl.* [L., pl. of *fungus*, a mushroom: see *fungus*.] One of the lowest of the great groups of cellular cryptogams. The *Fungi* are chiefly distinguished by the absence of chlorophyl, and therefore by the lack of power to assimilate inorganic substances, being thus dependent for their food upon living or dead organic matter obtained from other plants or from animals. Consequently, also, they do not inhale carbonic acid and give off oxygen as chlorophyllous plants do in assimilation, but do inhale oxygen and give off carbonic acid as other plants do in respiration. The vegetative system consists of filiform cells, called *hyphæ*, and the hyphæ of a fungus taken collectively are called the *mycelium*. The hyphæ are usually septate and branched; in some fungi, as *Peronosporeæ* and their allies, there are no septa except those which divide off the propagative cells or organs. Exceptions to the hyphal plan of structure occur in several cases. In the yeast-fungi and yeast-like stages of certain other fungi the plant consists of a succession of ellipsoid cells formed by budding; in the *Chytridieæ* certain species have no mycelium, but consist of a spherical or ovoid cell; in the bacteria the prevailing form is that of very minute spheres or rods, which multiply by fission; in the vegetative stage of the *Mycomycetes* there is only a mass of protoplasm. The mycelium is said to be *filamentous* when the hyphæ are separate, or at most but loosely interwoven, as in the common molds; *membranous* when the hyphæ are so interwoven as to form a layer; *fibrous* when the hyphæ form branching strands, the latter being often of considerable size and indurated. In some groups, as the mushrooms, the interwoven hyphæ form a compound fungus-body of definite and regular shape. Fungi are as-

prophytic or *parasitic*, according as that from which they obtain their food is a dead organic substance or a living organism. Some parasitic species are facultative saprophytes, and some saprophytic species are facultative parasites. Among the saprophytic fungi are the common domestic molds and mildews, the "dry-rot" fungi, the greater number of ascomycetous and basidiomycetous fungi, which grow on dead wood, leaves, etc., or organic matter in the soil, also many *Hyphomycetes*, and the *Myxomycetes*. Among the parasitic fungi are the *Uredineæ* or rusts and *Ustilagineæ* or smuts, which grow upon wild and cultivated plants, also most *Peronosporeæ*, as represented by the potato-rot and American grape-vine mildew. Among the *Ascomycetes*, the *Erysipheæ* (powdery mildews) are all parasitic, as are also many other *Pyrenomycetes* and a few *Discomycetes*. Many parasitic species, especially the rusts, smuts, and mildews, cause great destruction to cultivated crops. The lichens are now considered by many botanists to consist of fungi parasitic upon algæ (the gonidia). (See *lichen*.) A few fungi grow upon living animals and man. Several species of *Aspergillus* cause a disease (otomycosis) of the human ear. Other fungi produce the skin-diseases favus and ringworm. Bacteria are believed to cause most or all of the fevers and contagious diseases of man and the lower animals. Species of *Saprolegnia* cause epidemics among fishes, especially the salmon. The principal parasites upon insects belong to the *Entomophthoreæ* and the genus *Cordyceps*. (See cut under *Cordyceps*.) Silkworms are attacked by a species of *Botrytis*, and bacteria cause epidemics among silkworms and other insects. Both sexual and asexual reproduction occur in fungi; the latter is present in all, and in many is the only kind that has been observed. The asexual spores (conidia) are most frequently produced upon the tips of uninclosed hyphæ, as in *Hyphomycetes*, or on short hyphæ produced in conceptacles, but sometimes by free cell-formation, as in *Mucor*. The sexual organs are of three types. In the conjugating fungi, *Mucor* and its allies, reproduction takes place by the union of two similar cells to form a zygospore. In *Peronospora* and its allies oögonia and antheridia are formed; the antheridium comes in direct contact with the oögonium, and a transfer of the protoplasm into the oögonium takes place. In the *Ascomycetes*, so far as known, a carpogonium takes the place of the oögonium, and the product of fertilization is usually a perithecium or apothecium containing asci and spores. (See *Eurotium*.) Modern classifications of fungi are of two kinds. That proposed by F. Cohn in 1872 classes together in primary groups fungi and algæ having similar modes of reproduction, employing the peculiar fungal characters in distinguishing the secondary groups; but the usual method recognizes fungi as wholly distinct from algæ, separated by physiological and morphological characters, in this respect agreeing with the old method. The artificial system formerly in use and still retained in some English books divides the fungi into the orders *Ascomycetes*, *Physomycetes*, *Hyphomycetes*, *Coniomycetes*, *Gasteromycetes*, and *Hymenomycetes*. De Bary in 1861 made four divisions: *Phycomycetes*, *Hypodermiæ*, *Basidiomycetes*, and *Ascomycetes*. Goebel (1882) does not include *Myxomycetes* and *Schizomycetes* with *Fungi* proper, the latter he divides into *Chytridiaceæ*, *Ustilagineæ*, *Phycomycetes*, *Ascomycetes*, *Uredineæ*, and *Basidiomycetes*. The *Fungi Imperfecti* of modern authors include a large number of forms, of which some are known, and most are suspected, to be the asexual stages of *Ascomycetes*. The principal groups of *Fungi Imperfecti* are the *Sphæropideæ*, *Melanconieæ*, and *Hyphomycetes*. The number of known species of fungi is estimated at about 30,000. Most of the edible fungi are found among the mushrooms and puffballs; but the truffle and morel are ascomycetous. Most of the species recognised as poisonous are mushrooms; but the ergot-fungus is ascomycetous. Some smuts are poisonous to cattle. Some fungi produce poisonous substances, as alcohol, by fermentation. Also called *Fungales*. See cuts under *ascus*, *basidium*, *Clavaria*, *ergot*, *exoperidium*, *Fusicladium*, and *Puccinia*.

It is disk-shaped, with a large number of radiating partitions which extend from the center to a periphery not bounded by a vertical wall. prongs of the furcula commonly meet at an approximately acute angle, like a V, and there develop a process called the *hypostidium*; the extremities pass to each shoulder-joint. Sometimes the prongs meet at an open angle, like a U, and they may be ankylosed with the keel of the sternum. The furcula serves to keep the shoulders apart, and is strongest, with most open lines, in birds of the greatest powers of flight. It is occasionally rudimentary or defective, the clavicles being separate and very small, as occurs especially in some flightless birds. The furcula of the common fowl is familiar as the *merrythought* or *wishbone*. Also called *furculum* (with plural *furcula*).

The length of a furrow would ordinarily be equiv. to the length of the field; like other orig. indefinite terms of measure, the word came to have a definite value, being fixed by custom at 40 rods, and hence called in ML. (AL.) *quarentena*: see *quarantine*.] A measure of length equal to the eighth part of a mile, 40 rods, poles, or perches, 220 yards, or 201.17 meters. The furlong corresponds to the Roman stadium, and one eighth of any kind of mile is called a furlong in older writers. Thus, English writers of the sixteenth century often call 625 feet a furlong; and the reason is that 5 feet was taken to be a pace, so that a Roman mile of 1,000 paces would be 8 × 625 feet. So the eighth part of a Scotch mile, or nearly 742 feet, was a furlong. In the English translation of the New Testament *furlong* is used to translate the Greek *στάδιον*, stadium. Abbreviated *fur*.

furlough (fėr'lō), *n.* [The spelling *furloe* occurs in the 18th century, but *furlough* appears to be the earliest spelling (as in Blount's Gloss., ed. 1674). As the spelling *furlough* does not follow that of the orig. language, it was prob. intended to be phonetic (from a military point of view), the *gh* perhaps as *f* and the accent on the second syllable; < D. *verlof*, leave, furlough, = LG. *verlōf* = G. dial. *verlaub* (these prob. of Scand. origin). < Dan. *forlov*, leave, permission, furlough, leave of absence, = Sw. *förlof*, leave, pardon; a form (with prefix *for-*, *för-* = E. *for-*[1]) equiv. to the older Dan. *orlov*, leave of absence, furlough, = Sw. *orlof*, dismission, discharge, = Icel. *orlof*, leave, = D. *oorlof*, leave, = OHG. In the United States army the term is used officially only for such leave given to an enlisted man, the same permission granted to a commissioned officer being designated a *leave of absence*. A soldier availing himself of the permission is said to be *furloughed*, or *on furlough*; an officer, *on leave*. The word is also used to designate the temporary discharge from service of a civilian in the employ of the government. In the United States navy it has a special signification, indicating the condition of an officer off duty either for fault or at his own request and only receiving one half of "waiting-orders pay."

A structure in which to make and maintain a fire the heat of which is to be used for some mechanical purpose, as the melting of ores or metals, the production of steam as a power, the warming of apartments, the baking of pottery, etc.; specifically, a structure of considerable size built of stone or brick, and usually lined with fire-brick, used for some purpose connected with the operation of smelting metals. Furnaces are constructed in a great variety of ways, according to the different purposes to which they are to be applied. See *air-furnace, blast-furnace*, and *hearth*.

Base-burning furnace. See *base-burning*.—**Bone-black furnace.** See *bone-black*.—**Calcining-furnace,** a furnace in which the operation of calcining is performed; specifically, a reverberatory furnace, with a low arch, in which hard lead is "softened" by exposing it to the action of the flame, by which the foreign metals (antimony, copper, and iron) are oxidized, and collect on the surface of the metal in the form of dross. Also called *improving-furnace*, and the process of softening is also called *improving*.—**Carbonizing-furnace.** See *carbonize*.—**Castilian furnace,** a circular furnace, usually about 3 feet in diameter and 3½ feet high, having a breast formed by a semicircular iron pan furnished with a lip for running off the slags and a longitudinal slot for convenience in tapping. On the top of this cylinder, which is made of fire-brick, rests a box-shaped covering of masonry supported by four pillars, and in this are the feeding-door and the outlet for the products of combustion. The blast is obtained by means of a fan, and there are three twyers. This furnace is used in Spain for smelting poor ores of lead as well as rich slags. It has also been introduced to a limited extent in England.—**Catalan furnace** or **forge,** a furnace used in the French Pyrenees and in some parts of Spain for the manufacture of wrought-iron directly from the ore. It consists of a quadrangular hearth, made of some fire-resisting material, supported by one or more small arches, and built against the side of a wall like the ordinary blacksmiths' forge. The blast is supplied by a peculiar kind of blowing-machine called a *trompe*, in which the current of air is produced by the falling of water through a vertical tube. See *bloomery* and *forge*1.—**Cementation-furnace.** See *converting-furnace*.—**Converting-furnace,** a form of furnace in which bar-iron is converted into steel by carburization (which see). It consists essentially of an oblong rectangular case, called the *chest* or *pot*, open at the top, and inclosed within an arched fire-brick chamber, with arched openings at each end, through which a man can enter. The fireplace is underneath, and that and the flues are so arranged that the chest can be uniformly heated to a high temperature. The whole is inclosed within a hollow cone of brickwork, open at the top, like a glass-furnace. Two such chests are ordinarily built side by side, space being left for flues between the adjacent walls.—**Cupola blast-furnace,** the modern form of blast-furnace, resembling the cupola used for foundry purposes in being much less massive in construction than the old-fashioned blast-furnace, but at the same time of much greater size, the largest being over 100 feet in height and 25 in diameter across the bosh es. The cupola blast-furnace is built of radiating brickwork, inclosed within a wrought-iron casing.—**Cupola furnace.** See *cupola-furnace*.—**Danks rotary furnace,** a peculiar form of puddling-furnace (see *puddle*) in which the chamber in which the puddling is effected is made to rotate during the operation. It is claimed that the Danks furnace is more effective in eliminating the phosphorus and sulphur than the ordinary form of puddling-furnace.—**Decomposing-furnace,** a furnace used in the conversion of common salt into sulphate of soda, aided by the action of sulphuric acid.—**Dumb furnace,** a ventilating-furnace placed at the foot of the up-cast shaft of a mine, and arranged in such a way that, while the dangerous gases are drawn away, they cannot come in contact with the fire.—**Hardening-furnace,** in *hat-making*, a furnace in which the bodies of hats, folded in wet cloth, are laid upon an iron plate and hardened by the pressure of traversing-plates together with the heat and dampness.—**High furnace,** the ordinary blast-furnace: so called in literal translation from the French *haut fourneau*.—**Hydrocarbon-furnace,** a furnace in which a liquid fuel, as petroleum, is used.—**Muffle-furnace,** the small portable furnace in which is heated the muffle containing the cupels (see *cupel*) used in assaying gold and silver.—**Osmund furnace,** in *metal-working*, a primitive form of furnace formerly used in Sweden, and still in use in Finland, for reducing bog-iron ore. The lining of the furnace is of refractory stone, surrounding this, with a considerable earth-packed space intervening, is a crib of wood. The blast is furnished by bellows worked by treadles.—**Pernot furnace,** an open-hearth regenerative furnace for converting iron into steel, invented in France, but also introduced, with some modifications, to a limited extent in England. It requires for its use both pig and scrap. Its chief peculiarity is that its bed is inclined at a small angle (about 6°) and rotative.—**Plumbers' furnace,** a portable furnace used by plumbers for soldering, etc.—**Regenerative furnace,** a furnace in which the waste heat of the products of combustion is utilized by being transferred to either the air or the combustible gases, or both, entering the furnace. This transfer is effected by means of so-called "regenerators." See *regenerator*.—**Reheating-furnace,** a reverberatory furnace in which the puddled bars, piled in packets, are reheated preparatory to rolling, a balling-furnace.—**Reverberatory furnace,** a furnace in which the fuel is not brought directly in contact with the material to be acted on by the fire, but which is so arranged that the flame of the burning gases plays over or is "reverberated" upon the ore or metal under treatment. A peculiar kind of reverberatory furnace used in the manufacture of steel is called the *open hearth*. See *hearth*.—**Ring-top furnace,** a charcoal-furnace for heating smoothing-irons. It has an annular top, and cross-bars which can be removed at pleasure. *E. H. Knight*.—**Spanish furnace,** a form of reverberatory furnace used in Spain, and especially at Linares, one of the most important lead-producing districts in the world. Its chief peculiarity is the presence of two chambers, one of which is the reduction-chamber, while the other has a peculiar and not entirely understood action in checking and modifying the draft.—**Tank-furnace,** in *glass-manuf.*, a furnace fitted with a tank, as distinguished from comparatively small melting-pots, to hold the molten glass.

4. [*cap.*] In *classical myth.*, one of the avenging deities, called in Greek mythology the Erinyes or, by euphemism, Eumenides, and by the Romans the Furiæ or Diræ, daughters of Earth or of Night, represented as fearful maidens, often winged, and with serpents twined in their hair, clad in dusky garments girdled with red. They dwelt in the depth of Tartarus, and, owing to their dread power of avenging wrong, whether intentional or not, were feared by gods and men. According to fully developed Greek tradition, they were three in number and called Tisiphone, Alecto, and Megæra. They relentlessly punished crime, especially breaches of piety and hospitality, both before and after death. They were therefore also regarded as goddesses of fate, in common with the Parcæ; hence the use of the name in the extract from Milton.

Comes the blind *Fury* with the abhorred shears,
And slits the thin-spun life. *Milton*, Lycidas, l. 75.

fuse[2] (fūz), *n.* [Abbr. of *fusee*[1].] A tube, casing, ribbon, etc., of various materials, filled or saturated with a combustible compound, and used as an exploder for firing a blast or for igniting any exploding charge, as of a military shell. A common fuse consists of a rope-like tube filled with some slow-burning composition, as niter, sulphur, and mealed powder, its commonest use being to allow the one who ignites it time to get to a place of safety before the explosion. An *electric fuse* consists of the explosive substance so arranged as to be fired either by a spark of high-potential electricity formed at a break in an electric circuit (the so-called *tension-fuse*), or by the incandescence of a fine (for example, platinum) wire which forms part of the circuit through which the current is passed (the so-called *quantity-fuse*). By extension, devices performing the same function as the common fuse, as mechanical and chemical exploders of all kinds, are termed *fuses*. The fuses used for exploding projectiles are of four kinds: *time*, *percussion*, *concussion*, and *combination*. In the first class the time of burning is regulated by cutting the ribbon, composition-filled tube, etc., to the required length; the second is ignited by the impact of the projectile against an object; the third is operated by the shock of discharge; while the combination-fuses combine the principles of the other classes with more or less complexity. See *blasting-fuse*. Also spelled *fuze*.—**Abel fuse**, an electric fuse invented by Abel, the explosive material of which is composed of subsulphid and subphosphid of copper with potassium chlorate. It is fired by a spark.—**Percussion-fuse**, a fuse prepared for action by the shock of the discharge, and put in action on striking the object.—**Hamersley.**—**Quantity-fuse**, an electric fuse in which the conducting circuit is completed by a short piece of some substance, usually a metal, of tolerably high resistance, which is raised to a high temperature, practically to incandescence, on the passage of a current of sufficient strength.—**Safety-fuse**, a slow-burning ribbon or tape for exploding a blast.—**Tension-fuse**, an electric fuse in which the conducting circuit is not complete, the firing being accomplished by the passage of a spark.—**Wooden fuse**, a hollow plug of wood filled with fuse-composition firmly driven in, the open end being protected from moisture by a water-proof cap, used for exploding military shells. For service, a part of the plug is cut off, according to the length of time it is desired that the composition shall burn, and the plug is then driven into the hole in the shell.

2. A cone or solid conical piece in a watch or a spring-clock on which is wound a chain or cord, attached at one end to its widest part and at the other to the barrel containing the mainspring, the action of which unwinds it, transferring it to the barrel. The object of the fusee is to equalize the effect of the mainspring, as its force is relaxed through regular diminution of tension, by gradually diminishing the resistance of the chain or cord through its increasing distance from the axis of the fusee. This axis is the arbor of the main wheel, which is attached to the fusee and imparts the motion derived from the spring to the other wheels. In many watches the fusee is now dispensed with, its object being attained by other contrivances. The term is also applied to similar mechanical contrivances used for other purposes. Also called *fuse-wheel*.

fusion, the melting of anhydrous salts by heat without their undergoing any decomposition.—**Latent heat of fusion**, the heat which is expended in the molecular work involved in the change from the solid to the liquid state (See *latent heat*, under *heat*.) G

1. The seventh letter and fifth consonant in the English alphabet. It is a sign of Italic origin, having been fabricated by the Romans by a slight modification of C, when the distinction of the (hard) *g*-sound from the *k*-sound, both until then represented alike by *c*, was found advisable and was effected. (See *C*.) G has in English two principal or normal sounds, usually called "hard *g*" and "soft *g*" respectively. The former is the value originally belonging to the sign. The "hard" *g*-sound is the sonant (or voiced, or intonated) correlative of the *k*-sound, made by a close contact between the upper surface of the back part of the tongue and the adjacent palate, while breath enough to set the vocal chords vibrating is, during the continuance of the contact, forced up into the pharynx — the breach of this contact, as in the case of the other so-called mutes (or stops, or checks), giving the alphabetic element. The *k*- and *g*-sounds are most often called the guttural mutes; although (since the guttur proper has nothing to do with their formation) many authorities prefer to call them *palatal*, or *back-palatal*. The "soft" sound of *g* in English is compound (= *j* = *dzh*), the sonant correlative of the *ch*-sound (see *ch*); it is, like the soft *c*-sound in relation to hard *c*, a product of the alteration of the hard *g*, the point of contact being shifted forward on the tongue, and a spirant or sibilant vanish being added to the mute element. It belongs mainly to the Romance part of the language. It never occurs at the beginning of words of Anglo Saxon origin (where *g* is always hard or has changed to *y*); and but rarely at the end of such words (before "silent" *e*, as in *hinge*, *singe*, *swinge*). Except in such instances, *g*, in words of Germanic origin, is hard also before *e* and *i*. The principal digraphs containing *g* are *gh* and *ng*. The former is written instead of the earlier guttural spirant *h* (as *night* for earlier *niht*), and is either silent (as in *night*) or pronounced as *f* (as in *laugh*). With the digraph *ng* is written the nasal which corresponds to *g* and *k* in the same manner as *n* to *d* and *t*, or *m* to *b* and *p*, and which (for example, in *singing*) is just as much a simple sound as *n* or *m*. This guttural or palatal nasal is not an independent alphabetic element in any such way as is *n* or *m*, in the older stages of the languages of our family, it appears only before a next following *g* or *k*, as a nasal made guttural by assimilation to them; and the combination *ng* representing it is simply one in which the *g*, formerly pronounced, has become silent, like the *b* of *mb* in *lamb*, *climb*, *tomb*, etc. G is now silent before *n* in the same syllable, as in *gnaw*, *sign*. For *g* as the original of consonant *y*, see *y*.

gabbro (gab'rō), *n.* [A word of obscure origin used in Italy, but more especially in the neighborhood of Florence, and by the marble-workers there, and introduced into lithological science by Von Buch in 1809.] A rock of varied lithological character, essentially, according to the present general acceptation of the name among lithologists, a crystalline-granular aggregate of plagioclase and diallage, with which often occur magnetite (or menachanite) and apatite. Often the diallage is associated with a rhombic pyroxene (bronzite or hypersthene, two closely allied members of the augite or pyroxene family), and when this predominates the rock passes into what is called *norite*. Olivin is also frequently present, and the predominance of this mineral gives rise to combinations to which the names *olivin-gabbro* and *olivin-norite* have been given. The original gabbro of Von Buch, now called *saussurite-gabbro*, is one of the many alterative forms of gabbro proper, which is perhaps the most perplexing of all rocks in respect to the manifold nature of the alterations it is liable to undergo. In regard to the nomenclature of many of these there is not much present unity among lithologists. *Gabbro rosso* (It., red gabbro), a rock occurring at the junction of the serpentine and the macigno (a micaceous sandstone) of Tuscany, is an altered sedimentary formation very variable in texture and composition. *Gabbro verde* (It., green gabbro), or gabbro simply, as it is sometimes called, is serpentine. The gabbro verde of Tuscany does not contain diallage; the rock called *gabbro* in Corsica, on the other hand, has crystals of diallage disseminated through the serpentine. *Verde di Corsica* (It., Corsica green), a variety of gabbro now called by Italians *granitone* and *eufotide* (euphotide), is the beautiful green stone extensively employed in the interior decorations of the Medicean chapel in Florence. It is a crystalline aggregate of saussurite and smaragdite (a grass-green variety of hornblende). See *hypersthenite*.

By increasing the number of rows to cover the points of junction, complete protection can be attained. Gabions are also largely used to form the foundations of dams and jetties. Thus, in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus.

A sea-going vessel propelled by oars, or using both oars and sails. The earliest ships of all nations were of this class, and were at first confined chiefly to coasting or to the navigation of narrow seas. The war-galley of the Greeks originally had a single mast carrying one square sail amidships, and later two masts, but depended primarily upon its oars, ranged in a single line on each side, and each handled by one rower. It was rated according to the whole number of these. The principal sizes were the *triaconter*, of thirty oars, and the *penteconter*, of fifty. Ships of this form continued to be used as vessels of burden, but were early superseded for war by galleys rated according to the number of banks of oars or ranks of rowers, as the *bireme* (a two-banked vessel), *trireme, quadrireme*, etc. Greater numbers of banks are mentioned, up to forty banks of oars in a vessel of enormous size built for Ptolemy Philopator of Egypt. How these numerous banks of oars were arranged is not definitely known; it is probable that not more than three could have been placed one above another. The first recorded Roman fleet consisted wholly of triremes, and this was always the most common armament. The ancient naval vessels were long, sharp, and narrow in model, like a modern steamer, were capable of great speed, and carried large crews. Full decks, or several decks, were in time substituted for the primitive half-deck, or the short decks at the stem and stern; and ram, towers, and other means of offense and defense were added. Galleys continued in use in the Mediterranean and other seas till late in the seventeenth century, ordinary ones in later times having from five to twenty-five oars on a side in a single row, each oar worked by several men, with two or three masts and triangular sails; and indeed they may be considered as not yet entirely obsolete, being represented by the feluccas and boats of similar model on the Mediterranean and neighboring seas. Larger vessels were called *galleasses*. (See *galleass*.) The labor of rowing was from an early date assigned to mercenaries, and afterward to slaves and prisoners of war; and in some countries, especially France, nearly all criminals were condemned to service on the galleys of the state, and were hence called *galley-slaves*. See *trireme*.

M. Neale*, Eastern Church, i. 15.

Gallican Church, the branch of the Roman Catholic Church in France, which has enjoyed greater privileges and had a more independent development than the branches

of that church in other European countries. Its comparative independence has been due to the persistent resistance of the civil power, supported by a portion of the clergy and people distinctively called the Gallican party, to the encroachments of the papal power, but there has always been a strong ultramontane party in the French church favorable to papal claims.—**Gallican liberties**, the peculiar privileges enjoyed by the Gallican Church. In general they consisted of greater freedom from papal domination over the actions of the bishops and of the king than was customary in other Roman Catholic countries, or than is customary in France at the present time. These liberties were especially defined by the pragmatic sanction of Louis IX in 1269, by the pragmatic sanction of Charles VII. in 1438, and by the "Declaration of the Clergy" drawn up by Bossuet in 1682, which asserted the right of the king to intervene in church matters without papal interference. The Gallican liberties were confirmed under the rule of Napoleon I., but the French church is becoming increasingly ultramontane. **Gallican liturgies, Gallican liturgy**, the liturgies or group of liturgies anciently used in Gaul or France and in some adjacent countries, especially in Spain. In Gaul these liturgies were suppressed by Charlemagne and his successors in the ninth century, and the Roman office was substituted for them. The remains of these rites are few and fragmentary. The wording of some of the prayers in the different local uses differed greatly, but the important features and the arrangement of parts were the same throughout. The liturgies originally used in Spain were of the same class, so that the group has been called the Hispano-Gallican family of liturgies. In Spain these rites had by the eleventh century become almost entirely supplanted by the Roman, but at the beginning of the sixteenth century the typical Spanish form, known as the *Mozarabic liturgy*, was revived by Cardinal Ximenes. The ancient liturgies of the British, Irish, and Scotch apparently belonged to the Gallican group, but their classification is disputed, and the remains are scanty. The use established among the Anglo-Saxons by St. Augustine of Canterbury probably contained Gallican elements, of which there are traces in the Use of Sarum, etc. The Gallican type of liturgy is believed to be derived through the primitive churches of Arles and Lyons from Ephesus, and has accordingly been called *Ephesine*, and referred to St. Paul and St. John. It differs greatly from the Roman in its constituent parts, their names, and arrangement, and agrees in many and important particulars with eastern liturgies. The nomenclature of its various parts is, however, almost entirely peculiar to itself, and it is distinguished by the fact that most of these parts, retaining their titles and places in the office, are variable, the number of different occasions for which such variations are provided being also much greater than in other western rites, and this variation extending even to the canon. See *Mozarabic*.

II. *n.* In *Rom. Cath. theol.*, one who holds Gallican doctrines. See *Gallicanism*.

Gallicanism (gal'i-kan-izm), *n.* [< *Gallican* + *-ism*.] The spirit of nationalism within the French church, as opposed to the absolutism of the papal see. It grew in strength during the middle ages, and culminated in the reign of Louis XIV. The Gallican liberties, in which this spirit was expressed, disappeared at the time of the revolution; and, though since restored and nominally in existence, ultramontanism has during the nineteenth century triumphed over Gallicanism.

Thus, the use of the word 'assist' in the sense of 'be present' or of the phrase 'it goes without saying,' and similar expressions, are regarded as Gallicisms.

Cf. *gill*[4].] 1. An English measure of capacity for dry or liquid substances, but usually for liquids, containing 4 quarts. The old wine-gallon, which was declared by law to contain 231 cubic inches, and to be equal to a cylinder 7 inches in diameter and 6 inches high, is now the legal gallon of the United States, where it is taken as the volume of 8.3389 pounds avoirdupois of water at its maximum density weighed in air at 30 inches and 62° F. The imperial gallon now established in Great Britain for all liquid and dry substances contains 10 imperial pounds of distilled water at 62° F., weighed in air of the same temperature and at 30 inches. It has been ascertained to contain 277.274 cubic inches. A statute of 1266 declares that "8 pounds do make a gallon of wine, and 8 gallons of wine do make a bushel." There was thus but one legal gallon. The pound referred to in the statute was somewhat lighter than the troy pound, but it would seem that in course of time the avoirdupois pound was substituted in practice, for the wine-gallon universally used in the latter part of the seventeenth century contained 224.4 cubic inches, while 8 avoirdupois pounds of British wine (of gooseberry or elderberry) measure about 226 inches. This wine-gallon was generally supposed, and in 1689 was legally declared, to contain 231 cubic inches, so that it was found convenient in 1707 to legalize a standard that was more accurately of this capacity. This law remains in force in the United States, though that standard has long been disused. A statute of 1452 defined the gallon as 8 troy pounds of wheat (still recognizing but one gallon), but the standard exchequer gallon constructed under Henry VII., and supposed to represent the gallon then used, contains 274¼ cubic inches. It was generally thought to contain 272¼ inches, and the statute of 1697, defining dry measures, was intended to conform to this, although it actually makes the corn-gallon 268.6 cubic inches. Elizabeth constructed a standard gallon of 282 cubic inches (or nearly 8 pounds avoirdupois of wheat), which became the old ale-gallon. The Irish gallon, which from 1450 to 1695 had contained 8 pounds troy of wine, was at the latter date carried to 272¼ cubic inches; but in 1785 it was again changed to 217.1 cubic inches for all purposes. The Scotch gallon was no less than 840 cubic inches. The United States gallon is equivalent to 3.7853 liters. Abbreviated *gal*.

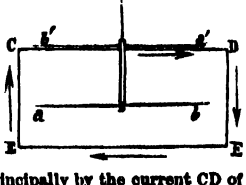
galvanomagnetic (gal'vạ-nō-mag-net'ik), *a.* Same as *electromagnetic*.

galvanometer (gal-vạ-nom'e-tėr), *n.* [< *galvanic* + Gr. μέτρον, a measure.] An instrument for detecting the existence and determining the strength and direction of an electric current. In all galvanometers the principle of action is the same. It depends upon the force which Oersted discovered to be exerted between a magnetic needle and a wire carrying a current—a force which tends to set the needle at right angles to the direction of the current, and whose intensity, other things remaining the same, depends directly upon the strength of the current.

The term *galvanometer* is applied to an instrument for measuring the strength of electric currents by means of the deflection of a magnetic needle round which the current is caused to flow through a coil of wire.



S. P. Thompson, Elect. and Mag.

Aperiodic galvanometer, a dead-beat or thoroughly damped galvanometer.—**Astatic galvanometer**, an instrument which consists of a pair of similar needles magnetized, with their poles turned opposite ways, and stiffly connected at their centers, so that both will swing together

Astatic Galvanometer.

The one tends always to turn in a direction opposite to the other under the earth's magnetic attraction, so that if the needles were perfectly alike they would form a perfectly astatic pair, or a pair that would not tend to assume any particular direction from the magnetic influence of the earth. One of the needles, *ab*, is nearly in the center of the coil, CDEF, through which the current passes; the other, *a'b'*, just above the coil. When a current traverses the coil in the direction of the arrows, the action of all parts of the current upon the lower needle tends to urge the austral pole *a* toward the back of the figure and the boreal pole *b* to the front, while the upper needle, *a'b'*, is affected principally by the current CD of the coil, which urges the austral pole *a'* to the front of the figure and the boreal pole *b'* to the back. Both needles are thus urged to rotate in the same direction by the current, and, as the opposing action of the earth is greatly enfeebled by the combination, a much larger deflection is obtained than would be given by one of the needles if employed alone. Galvanometers are also made astatic by the use of a fixed magnet so placed as to counteract the influence of the earth's magnetism.—**Ballistic galvanometer**, an instrument used to measure the strength of a current which acts for only a very short time, as that produced by the discharge of a condenser. It involves the use of a heavy needle, which takes a relatively long time to swing. The sine of half the angle of the first swing is proportional to the quantity of electricity which has flowed through the coil.—**Dead-beat galvanometer**, a galvanometer in which the needle is so damped, by induction or otherwise, that on the passage of a current it will move to its final deflection without oscillation.—**Differential galvanometer**, a form of galvanometer in which the coil consists of two separate wires wound side by side, and used to compare two currents. If the currents are sent in opposite directions through these wires the motion of the needle will be determined by the difference in their intensity; if they were equal the needle would remain stationary.—**Sine galvanometer**, a magnetic needle poised at the center of a coil of insulated copper wire wound round a vertical circle that may be turned horizontally on its stand. In use the needle and vertical circle are at first both in the magnetic meridian. When a current passes, the needle is deflected, and the vertical coil is turned by the observer until its plane coincides with the magnetic axis of the needle. The strength of the current is as the sine of the angular deviation.

Any sensitive galvanometer in which the needle is directed by the earth's magnetism can be used as a *sine galvanometer*, provided the frame on which the coils are wound is capable of being turned round a central axis.

S. P. Thompson, Elect. and Mag., p. 167.

Tangent galvanometer, a very short magnetic needle delicately suspended so as to turn in a horizontal plane. The point about which it turns is at the center of a vertical coil of copper wire through which the current is passed. The diameter of the coil is at least ten or twelve times the length of the needle. The needle is therefore usually not more than half an inch long; and, for convenience of reading its deflections, long light pointers of aluminium or of glass fiber are cemented to its ends. In use the instrument is placed so that the vertical coil of copper wire is in the plane of the magnetic meridian. The current is then sent through the coil, and the angle by which the needle is deflected is read off. The strength of the current then is proportional to the tangent of the angle of deflection, whence the name of the instrument.—**Thomson's mirror galvanometer**, the most sensitive galvanometer yet invented. Its needle, which is very short, is rigidly attached to a small, light, concave mirror, and suspended in the center of a vertical coil of very small diameter by a silk fiber. A movable magnet is provided for bringing the needle into the plane of the coil when the latter does not coincide with the magnetic meridian, and also for rendering the needle more or less astatic. Needle, mirror, and magnet weigh only about 1¼ grains. At a distance of two or three feet from the mirror is a solid wooden stand, with a graduated scale, facing the mirror. In the stand, just under the center of the scale, a hole is cut, and a fine wire is stretched upright across it. A strong lamp stands behind the opening, so that its light will fall on the mirror and be reflected back on the scale. An image of the wire will thus be constantly thrown on the scale, and the slightest motion of the needle and its mirror will produce a much greater motion of this image. As the current flows the one way or the other the index will move to one side or the other. This galvanometer was devised for use in connection with the Atlantic submarine cables. It was long the only instrument with which signals could be read through long submarine lines; and it is still employed to a great extent, though now superseded by the siphon-recorder of the same inventor.

As applied to art-work, the phrase refers to the process of electroplating a plaster model with bronze, the mold being afterward destroyed and the plaster withdrawn, leaving a hollow figure in bronze. As applied to ornamental work in glass, the phrase is used for a method of decorating glass surfaces by means of electroplating, the design being first traced on the glass in some metallic pigment and burned in.

The games of classical antiquity were chiefly public trials of athletic skill and endurance, as in throwing the discus, wrestling, boxing, leaping, running, horse- and chariot-racing, etc. They were exhibited either periodically, usually in honor of some god, as the Olympic, Pythian, Nemean, and Isthmian games of Greece, the Ludi Apollinares at Rome, etc., or from time to time for the amusement of the people, as the Circensian games at Rome. The prizes in the Greek periodical games were generally without intrinsic value, as garlands or wreaths of olive- or laurel-leaves, of parsley, etc.; but at the Panathenaic games of Athens the prizes were quantities of olive-oil from the consecrated orchards, given in a special type of painted amphoræ, of which a hundred or more might constitute a single prize. The four great Greek national games formed the strongest bond in the nature of a national union between the various independent Greek states. At them any person of Hellenic blood had the right to contest for the victory, the most highly esteemed honor in Greece; and citizens of all states, however hostile, met at these games in peace.

ganglion (gang'gli-on), *n.*; pl. *ganglions*, *ganglia* (-onz, -ä). [< LL. *ganglion*, a tumor, < Gr. γάγγλιον, a tumor under the skin, on or near a tendon.] 1. An enlargement in the course of a nerve, containing or consisting of a collection of ganglion-cells; any assembly of ganglion-cells. The nervous system of invertebrates generally, and the sympathetic nervous system of vertebrates, consists essentially of a chain or series of ganglia connected by commissures, giving off filaments in various directions, forming plexuses or networks around principal viscera, blood-vessels, and other important organs. Some of the larger sympathetic ganglia are also called *plexuses*; thus, the semilunar ganglia of the abdomen form the solar plexus. In the cerebrospinal nervous system of vertebrates, ganglia regularly occur on the posterior or sensory roots of the spinal nerves. There are likewise ganglia upon some of the motor or sensorimotor cranial nerves, as the vagus, fifth, and facial. All the masses of gray neurine in the brain are also ganglia, as the optic thalami, corpora quadrigemina, corpora striata, etc.; even the general mass of cortical gray matter, both of the cerebrum and of the cerebellum, constitutes a great ganglion. The principal ganglia have special names. See the phrases below.

In addition to the function which belongs to nerve-fibers of receiving and transmitting nervous impulses, ganglion-cells may have the function of distributing, increasing, diminishing, and in some cases apparently of initiating such impulses, as well as of being a trophical center for nerve-fibers connected with them. Such cells are abundant in the gray matter of the brain and spinal cord, in the ganglia of the dorsal roots of spinal nerves, and in the ganglia of the sympathetic system, and they may exist as scattered cells or form plexuses, as those of Auerbach and Meissner. Besides these unipolar, bipolar, and multipolar cells, cells without processes have been described as ganglion-cells, and called *apolar*. They are regarded by some as having lost their processes in the course of anatomical and microscopic manipulation, and by others as being embryonic forms. Ganglion-cells, with the nerve-fibers and certain terminal structures, make up the essential parts of the nervous system. See cut under *retina*.

Sometimes the *gangue* prevails in the vein to the entire exclusion of ore. The words *gangue* and *veinstone* are not properly used to designate the material with which the ore is associated when this consists chiefly of fragments of the country-rock mingled with flucan, etc. This is what the miners designate as the *filling-up*. See *vein* and *comb*1, 6.

Also called *gang-tide*. See *rogation*.

metal., a hard, silicious rock forming the floor of some coal-seams in England. It is used as a refractory material, and also for flagging. Ganister is also artificially made by mixing ground quartz and fire-clay; this artificial form is used for lining Bessemer converters. Calcined, pulverized, and sifted ganister is used on a straight buff stick of bull-neck leather to smooth the threaded shoulders of socket-knives after they have been filed. — **Ganister beds**, a series of beds in the northern counties of England, immediately over the millstone-grit, belonging to the lower coal-measures; they produce excellent flagstones. One seam of coal in England is called the *ganister coal*, because it almost always has a ganister floor. Hence the name *ganister beds* has been given to the lower coal-measures.

It is about 3 feet long and 6 feet in stretch of wings, and of a white color tinged with amber-yellow on the head, with black primaries.

Gannet (*Sula bassana*), adult and young

It inhabits the Atlantic coasts of Europe and North America, feeds on fish, which it catches by pouncing down upon them from on high, and congregates in vast numbers to breed in certain rocky places on the seacoast. It is a strong flier, but is not found far from land. Some of the principal breeding-places are the Hebrides, St. Kilda, Ailsa Craig, and the Bass Rock, on the European coast, and the "Gannet Rock," in the gulf of St. Lawrence. The flesh is rank, but the young are sometimes eaten, and the old birds are taken in numbers for their feathers.

The genera *Archegosaurus* and *Dendrerpeton* are adduced by Owen as examples of this order.

Owen has distinguished the oldest forms [of labyrinthodonts] with armoured skull as *Ganocephala*.
Claus, Zoölogy (trans.), II. 188.

See cut under *scale*. — 2. Having ganoid scales or plates, as a fish; specifically, of or pertaining to the *Ganoidei*: as, a *ganoid* fauna.

II. *n.* One of the *Ganoidei*; a fish of the order *Ganoidei*.

Also *ganoidean*, *ganoidian*.

Ganoidei (ga-noi'dē-ī), *n. pl.* [NL., pl. of *ganoideus*: see *ganoid*.] 1. In Agassiz's system of classification, one of four orders into which the class of fishes was divided. It contained those which have ganoid scales or plates of an angular, rhomboidal, polygonal, or subcircular form, as distinguished from those with placoid, cycloid, or ctenoid scales. As thus framed by Agassiz, the ganoids were an artificial group, including siluroids, plectognaths, lophobranchs, and other teleost fishes. By Owen the *Ganoidei* were divided into two suborders, *Lepidoganoidei* and *Placoganoidei*. By later authors the group has been restricted and raised to the rank of a subclass.

Hence — 2. In Müller's system, a subclass of fishes with muscular or multivalvular aortic bulb, free branchiæ, covered gill-cavity, and no optic chiasm, a spiral intestinal valve (sometimes rudimentary), and usually fulcra on one or more fins. It was divided by Müller into two orders: *Chondrostei*, with a cartilaginous skeleton, as the sturgeons and paddle-fishes, and *Holostei*, with bony skeleton, as the *Polypteridæ*, *Lepidosteidæ*, *Amiidæ*, and many extinct forms. Each one of the existing families of ganoids has been made the type of an order by late writers. Thus, the sturgeons (*Acipenseridæ*) typify the order *Chondrostei* in a restricted sense, or *Glanostomi*; the paddle-fishes (*Polyodontidæ* or *Spatularudæ*), the order *Selachostomi*; the bichirs (*Polypteridæ*), the order *Crossopterygia* or *Actinistia*; the bony pikes or gars (*Lepidosteidæ*), the order *Rhomboganoidei* or *Gingly modi*, and the bowfins (*Amiidæ*), the order *Cycloganoidei* or *Halecomorphi*. Besides these there are three extinct orders, *Acanthodini*, *Placodermi*, and *Pycnodontini*. The ganoids abounded in former geologic periods, as far back as the Silurian; but the few above named are the only extant types. See *ganoid*, *n.* Also *Ganoidea*.

ganoidian (ga-noi'di-an), *a.* and *n.* Same as *ganoid*.

ganoin (gan'ō-in), *n.* [< Gr. *γάνος*, brightness, sheen, luster (see *ganoid*), + *-in*2.] The peculiar bony tissue which gives the enamel-like luster and transparency to the plates of ganoid fishes and of some labyrinthodonts. It is simply dense homogeneous bone.

Formerly the knights companions were elected by the body itself, but since the reign of George III. appointments have been made by the sovereign. The order, at first (and still sometimes) called the Order of St. George, was instituted by Edward III. some time between 1344 and 1350, the uncertainty arising from the early loss of all its original records. Its purpose has been supposed to have been at first only temporary. According to the common legend, probably fictitious, King Edward III. picked up a garter dropped by the Countess of Salisbury at a ball, and placed it on his own knee, with the words to his courtiers, in response to the notice taken of the incident, *Honi soit qui mal y pense* (shamed be he who thinks evil of it). To this incident the foundation, the name, and the motto of the order are usually ascribed. The insignia of the order are the garter, a blue ribbon of velvet edged with gold and having a gold buckle, worn on the left leg; the badge, called the George or great George, a figure of St. George killing the dragon, pendent from the collar of gold, which has twenty-six pieces, each representing a coiled garter; the lesser George, worn on a broad blue ribbon over the left shoulder; and the star of eight points, of silver, having in the middle the cross of St. George encircled by the garter. The vesture consists of a mantle of blue velvet lined with white taffeta, a hood and surcoat of crimson velvet, and a hat of black velvet with a plume of white ostrich-feathers, having in the center a tuft of black heron-feathers. When the sovereign is a woman, she wears the ribbon on the left arm.—**Prick the garter.** See *fast and loose*, under *fast*[1].

gas (gas), *n.* [A word invented by the Belgian chemist Van Helmont (died 1644), who expressly says "Hunc spiritum, incognitum hactenus, novo nomine *gas* voco" (this vapor, hitherto unknown, I call by a new name, *gas*). The word came into general use: D. G. Dan. Sw. *gas*, F. Pg. *gas*, Sp. It. *gas*, Russ. *gasŭ*, Hind. *gās*, etc. Various guesses have been made at the word which might possibly have suggested the particular syllable *gas*, as D. *geest* (AS. *gāst*, E. *ghost*), spirit; G. *gischt*, froth, foam; Sw. *gäsa*, ferment, efferverse; F. *gaze*, gauze, etc.] 1. A substance possessing perfect molecular mobility and the property of indefinite expansion. The term was originally synonymous with *air*, but was afterward applied to substances supposed (but wrongly—see below) to be incapable of reduction to a liquid or solid state. In accordance with this use a gas was defined to be a permanently elastic fluid or air differing from common air. According to the kinetic theory of gases, now accepted, the molecules of a gas are in a state of rapid motion in right lines, constantly colliding with one another and with the walls of any containing vessel, and hence exerting pressure against them. For example, in the case of air at ordinary temperatures it is calculated that the average velocity of the molecules is about that of a rifle-bullet as it leaves the gun. If a gas is compressed into less volume, the number of impacts against the sides of the containing vessel is in-

creased, and hence the pressure or tension increases, and conversely (*Boyle's law*). The temperature, according to this theory, is the average kinetic energy of a molecule; hence, increased temperature brings increased momentum, and so increased pressure on the walls of the vessel. This theory also explains many of the phenomena of viscosity, diffusion, etc. By increased pressure and diminished temperature (at least below the critical point) any gas can be reduced to the liquid form, the amount of pressure and degree of cold required differing widely with different gases. The so-called *fixed* or *permanent gases*, which were long supposed to be incoercible, as hydrogen, oxygen, nitrogen, etc., yield only to extreme conditions of cold and pressure. There is no essential difference between a *gas* and a *vapor* (see *vapor*), but for convenience the latter name is given to the gaseous form of substances which under the ordinary conditions of temperature and pressure are liquids or solids. Vapors and the gases most easily liquefied deviate most widely from Boyle's law, that the volume is inversely proportional to the pressure, and also from the law of the constant increment of expansion with increase of temperature. *Gases* are distinguished from *liquids* by the name of *elastic fluids*, because of their power of indefinite expansion. (See *liquid*.) The number of gaseous bodies is great, and they differ greatly in their chemical properties. They are all, however, susceptible of combining chemically with fluid and solid substances. Some of them are of great importance in the arts and manufactures, as, for example, carbonic acid or carbon dioxid, sulphurous acid or sulphur dioxid, and coal-gas. Gases are ordinarily invisible.

That such subterraneal steams will easily mingle with liquors, and imbue them with their own qualities, may be inferred from the experiment of mixing the *gas* (as the Helmontians call it), or the scarce coagulable fumes of kindled and extinguished brimstone, with wine, which is thereby long preserved.
Boyle, Origin and Virtues of Gems, ii.

Gases are distinguished from other forms of matter, not only by their power of indefinite expansion so as to fill any vessel, however large, and by the great effect which heat has in dilating them, but by the uniformity and simplicity of the laws which regulate their changes.
Clerk Maxwell, Heat, p. 81.

Specifically—2. In *coal-mining*, any explosive mixture of fire-damp with common air.—3. In popular language, a compound of various gases, used for illuminating and heating purposes. It is some form of carbureted hydrogen artificially made and distributed by pipes to points of consumption. The common kind is *coal-gas*, obtained from bituminous coals by carbonization in retorts at a high temperature. A carbureted hydrogen gas, called *water-gas*, resulting from the passing of steam through a mass of incandescent carbon and the subsequent admixture of hydrocarbons or other enriching substances, is also used. *Oil-gas* is an illuminating gas obtained by the distilling at high temperature of petroleum or other liquid hydrocarbons. 4. A gas-light: as, the *gas* is dim; turn down the *gas*. [Colloq.]—5. Empty or idle talk; frothy speech; rant. [Colloq.]

See *absorption*.—**Diffusion of gases.** See *diffusion*.—**Effusion of gases.** See *effusion*.—**Gas-liquor**, liquor separated by condensers from crude coal-gas in the process of manufacture. It contains in solution a number of ammonium compounds which would diminish the illuminating power of the gas, and from which ammonium sulphate and chlorid are manufactured.—**Natural gas**, combustible gas formed naturally in the earth. It is sometimes found issuing through crevices, but is generally obtained by boring. Natural gas has long been used in western China and elsewhere. It has been found in great abundance in western Pennsylvania and the adjoining region of New York, as also to a limited extent in Ohio, Indiana, and West Virginia. It was first utilized in New York in 1821, and began about 1874 to be of importance commercially, especially in the vicinity of Pittsburgh. The area over which natural gas and petroleum are obtained in quantity, and the conditions of their occurrence, are in most respects essentially the same, but the principal source of the gas in Ohio and Indiana is a formation lower down in the geological series than that furnishing it in Pennsylvania. In the former States the gas comes from the Trenton limestone, a group belonging to the Lower Silurian; in the latter, from the Devonian. The natural gas burned at Pittsburgh contains about 67 per cent. of marsh-gas, 22 of hydrogen, 5 of an ethylene compound, 3 of nitrogen, together with a small percentage of carbonic acid, carbonic oxid, olefiant gas, and oxygen.—**Rock-gas.** Same as *natural gas*.

Gas-burners are made in many shapes and types, but in all the object is to insure the complete exposure of the burning gas to a fresh supply of oxygen, and thus to obtain the greatest amount of light with the least expenditure of gas. The resulting flames assume the fanciful forms of beaks, bats' wings, fish-tails, cock-spurs, etc., whence the different forms of burners have received distinctive names. The material used to tip or form the tops of the burners has also given names to them, as the lava-tip burner. See *burner*.—**Argand gas-burner**, a gas-burner made to produce a flame on the principle of that of the Argand lamp (which see, under *lamp*).—**Intensive gas-burner**, a multiple gas-burner formed by a number of bat's-wing burners arranged circularly about the supply-pipe. In small-arms the metallic cartridge-case, copper or brass, serves as an effective gas-check. (See *obturation*, *obturator*, *fermeture*.) The Broadwell gas-check consists of a curved steel or copper ring and a circular bearing-plate slightly hollowed out. The curved ring is fitted into a counterbore or recess in the rear end of the bore or chamber, and is held firmly in position by the breech-closing apparatus carrying the bearing-plate. The ring is self-adjusting in its seat, and the bearing-plate is easily adjusted. On firing, the gas expands the lip of the ring against the walls of the chamber, and this expansion prevents the escape of gas. The Krupp guns are furnished with this device.

gas-meter (gas'mē'tėr), *n.* An apparatus through which illuminating gas is made to pass, in order to ascertain the number of cubic feet of it produced at gas-works or consumed by those supplied with it. Of this apparatus there are two types, the wet and the dry, the former being now principally used for measuring the quantity produced, and the latter, on a much smaller scale, the quantity consumed. The wet meter is composed of an outer box about three fifths filled with water. Within this is a revolving four-chambered drum, each chamber being capable of containing a definite quantity of gas, which is admitted through a pipe in the center of the meter, and, owing to the arrangement of the partitions of the chambers, causes the drum to maintain a constant revolution. This sets in motion a train of wheels carrying the hands over the dials which mark the quantity of gas passing. The dry meter consists of two or three chambers, each divided by a flexible partition or diaphragm, by the motion of which the capacity on one side is diminished, while that on the other is increased. By means of slide-valves, like those of a steam-engine, worked by the movement of the diaphragms, the gas to be measured passes alternately in and out of each space. The contractions and expansions set in motion the clockwork which marks the rate of consumption. The diaphragms in all the chambers are so connected that they move in concert.

upper end, and resting at the open lower end in a masonry or brickwork water-tank of corresponding form, in which it rises or falls according to the amount of gas passing into or out of it. The holder (often more than 100 feet in diameter, and sometimes made in telescoping sections) is suspended from a heavy framework by chains passing over pulleys and terminating in partially counterbalancing weights, which aid in regulating the pressure. The name *gas-holder* is often used for the whole structure, as more appropriate than *gasometer*, since it is not in any sense a meter.

Gasteropoda, Gastropoda (gas-tę-rop'ō-dą, gas-trop'ō-dą), *n. pl.* [NL. (Cuvier, 1798), neut. pl. of *gasteropus, gastropus* (*-pod-*): see *gasteropodous*.] A group of mollusks to which different values and limits have been assigned. (*a*) Originally it was considered by some as a section and by others as an order of the mollusks, which were then ranked as a class. Later it was raised to a class and almost universally accepted as such (1) It has generally been customary to include in it all the mollusks with a distinct head and foot developed from the abdominal surface, thus contrasted with the classes *Cephalopoda* and *Pteropoda*. (2) By many it has been extended to include all having a head, thus embracing the *Pteropoda* and excluding only the *Cephalopoda*. (3) By others it has been restricted to those having a distinct head, abdominal foot, and a spiral, subspiral, or low oval or conic shell or naked body, thus excluding the *Scaphopoda*. (4) By others still it has been further confined to those having a spiral or subspiral shell or naked body, and a more or less asymmetrical arrangement of the internal organs, the *Chitonidæ* and some naked related types being consequently eliminated. Within even the narrowest limits assigned to it, the class is very diversified. Generally a univalve shell is developed, but in many forms of several orders or suborders the shell is obsolete or entirely absent in the adult. Even in the naked forms, however, the embryo or larva is generally provided with a shell. The shell is usually spiral, or rather of an elongated conic form wound round in a spiral coil, but varying from a very high turreted form to a discoid or even sunken spire, an intermediate stage being the most common; in various types it is of a broad conic or patelliform shape, and in others, especially the terrestrial slugs, it is reduced to a scale-like element concealed under the mantle. The shape of the shell generally agrees with the structure of the soft parts, but sometimes differs so much that a gastropod can only be properly classified by examination of the anatomy of the animal. In most marine species, as well as in many terrestrial ones, an operculum more or less closing the aperture of the shell is developed from the foot of the animal; but in most of the land-shells (*Pulmonifera*) it is wanting. One of the distinguishing characteristics of *Gasteropoda*, giving name to the class, is the foot, which is generally broad, muscular, and disk-like, and attached to the ventral surface, but in some it is obsolete, and in others, as the heteropods, compressed and adapted for swimming. The garden-snail may be regarded as a typical gastropod. The class comprises also whelks, periwinkles, limpets, cowries, and many other univalve or shell-less forms. No known gastropod has a bivalve shell. *Cochlides* is a synonym. (*b*) In Lamarck's system of classification (1812–19), a suborder or order of *Cephalæa* (*Gasteropodes* of Cuvier), containing those gastropods in which the shell is reduced or wanting, thus including the nudibranchiates, limaciform pulmonates, and similar forms collectively contrasted with *Trachelipoda*.

See *gastrula*. It is a supposed primeval intestinal animal of the form-value of a gastrula (palingenetic archigastrula) or germ-cup, consisting of two germ-layers or blastodermic membranes, ectoderm and endoderm, the latter inclosing a visceral cavity or archenteron, and being itself inclosed in the ectoderm, and having a protostoma or primitive blastoporic communication with the exterior. Snakes seldom have on the belly many small scales like those of the back and sides, being usually furnished instead with short, wide, transverse gastrosteges which reach from side to side, and are imbricated, the hind edge of one overlapping the fore edge of the next succeeding. By muscular action when the snake is wriggling the whole series of gastrosteges stand somewhat on edge, so that their sharp hind borders catch on the slightest inequality of the surface, over which the snake thus glides as if pushed along by numberless little feet. That such is the action of the gastrosteges may be inferred from the ineffectual writhing of a snake when placed on a perfectly smooth surface, as a plate of glass. The last gastrostege, technically called the *preanal* or *postabdominal*, is usually bifid, or otherwise modified. Scutes somewhat like gastrosteges cover the under side of the tail, and are known as *urosteges*. See *urosteye*.

Huxley, Encyc. Brit., II. 52.

Gastrovascular canal, a connection or communication between the enteric cavity proper and some part of the body-cavity.

In many Invertebrata, one or more diverticula of the archenteron extend into the perienteron and its contained mesoblast. Sometimes, as in the Coelenterata, these remain connected with the alimentary cavity throughout life, and are termed *gastrovascular canals*.

gastrula (gas'trō-lą), *n.*; pl. *gastrulæ* (-lē). [NL., dim. of L. *guster*, < Gr. γαστήρ, belly, stomach: see *gaster*[2].] In *embryol.*, that form of the germ of the *Metazoa* which is a germ-cup of which the walls consist of two layers.

A, external view. *B*, longitudinal section through the axis: *g*, primitive intestine (primitive intestinal cavity); *e*, blastopore or primitive mouth (primitive mouth-opening); *i*, inner cell-layer of the body-wall (the inner germ-layer, hypoblast, endoderm, or intestinal layer); *e*, outer cell-layer (the outer germ-layer, epiblast, ectoderm, or skin-layer). (From Haeckel's "Evolution of Man.")

It is the result of that process of invagination which occurs in most animals, whereby a vesicular morula, blastosphere, or blastula is converted into a cup-like two-layered germ, with a blastopore or orifice of invagination, and an endoderm or membrane inclosing a primitive intestinal cavity, the endoderm itself being inclosed within an ectoderm. The word enters into many loose compounds of obvious meaning, as *gastrula-body*, *-cup*, *-form*, *-formation*, *-germ*, *-mouth*, *-stage*, *-stomach*, etc., mostly derived from the translation of the German compounds used in Haeckel's works. See *gastrulation*.

The stage of embryonic development in which the cellular wall consists of two layers of cells is called by Haeckel the "*gastrula* stage." *L. F. Ward*, Dynam. Sociol., I. 339.

animals gastrulation consists in the invagination of the blastula, and succeeds blastulation; in some, as mammals,

Gastrulation, following Segmentation of the Vitellus or Egg-cleavage of three kinds of Holoblastic Ova, or those which undergo total cleavage, seen in perpendicular cross-section through median plane of primitive intestinal cavity: *e*, outer or epiblastic or ectoderm cells (skin-layer), light; *f*, inner or hypoblastic or endoderm cells (intestinal layer), dark. (No nutritive yolk in these eggs; none advanced enough to show any mesoblastic cells or mesoderm.) In all, same letters mark same parts: *c*, the egg, ovum, cytula, or parent-cell; *f*, cleavage-cells, blastomeres, or segmentula; *m*, mulberry-germ; or morula; *b*, vesicular germ or blastula; *g*, germ-cup or gastrula; *z*, cleavage-cavity, blastocœle, or hollow of blastulation; *d*, primitive intestinal cavity, archenteron, or hollow of gastrulation; *o*, primitive mouth, archæostoma, or blastopore. Figs. 12–17. Total but unequal egg-cleavage of a mammal (woman), resulting in another modified amphigastrula or hood gastrula. 12, cytula; 13, cleavage stage of 2 cells; 14, same, of 4 cells; 15, morula beginning to undergo gastrulation without actual blastulation; 16, gastrulation further advanced (theoretically corresponding to the blastulæ of figs. 4, 5 and 10); 17, gastrulation completed (and to be followed, not preceded as in the other cases, by blastulation, or the formation of a blastodermic vesicle). (From Haeckel's "Evolution of Man.")

a kind of gastrulation ensues directly upon morulation, and therefore precedes blastulation.

Several forms of washer have been in use, the essential principle of all being the bringing of every particle of the gas into intimate contact with water, for which ammonia has a strong affinity. The gas passes from the washer to the gas-purifier. See also *scrubber*.

In some places, in observance of this custom, special structures following the general form of gates may have been erected to receive the throne of the justiciary. In the early middle ages, in various regions of Europe, as in southern France and in Italy, it was the custom for the king or the feudal lord to administer justice seated at the gates of the chief church: whence the expressions, with reference to judicial sentences, "at the gates," or "at the lions," in allusion to the sculptured lions with which the church gates were commonly adorned, as at the cathedral of St. Trophimus in Arles. Compare *Sublime Porte*, under *Porte*.

Gates of death. See *death's door*, under *death*.—**Ivory gate**, in poetical imagery, the semi-transparent gate of the house of Sleep, through which dreams appear distorted so as to assume flattering but delusive forms. The other gate is of transparent horn, through which true visions are seen by the dreamer. The allusion is to a legend in Greek mythology.

Two *gates* the silent house of Sleep adorn,
Of polish'd *ivory* this, that of transparent horn:
True visions through transparent horn arise;
Through polish'd ivory pass deluding lies.

A glove; specifically, in *medieval armor*, a glove of defense, either attached to the defensive armor of the arm or separate from it. Throughout the twelfth and thirteenth centuries the sleeve of the hauberk was long, and closed at the end covering the hands in the form of mittens; a glove of leather was worn beneath the mail to protect the hand from the chafing of the metal rings. Toward the end of the thirteenth century a slit was made at the palm, through which the hand could be passed, allowing the mail mitten to hang from the wrist. A few instances of mail gauntlets with separated fingers appear in English monuments of the same period. In the fourteenth century the separate armed glove appears, consisting at first of leather upon which roundels and other plates of steel are sewed; and about 1350 is found the completely articulated glove of hammered steel, each finger separate and each joint free to bend. The changes after this are merely in the direction of greater delicacy of execution, allowing still freer movement. In tourneys and justs the left hand was sometimes guarded by a heavy steel glove without joints. See *main-de-fer.* Also called *glove-of-mail.*

A, Gauntlet of plate, early 14th century. *B*, Gauntlet of plate, later 14th century. *C*, Gauntlet of mail forming part of the hauberk, 13th century. (From Viollet-le-Duc's "Dict. du Mobilier français.")

Hind. *gazī*, thin, coarse cotton cloth. The Hind. *gāchh, gāch*, gauze, is from the E. word.] I. *n.* 1. Compare *gavelkind*.

In the case of the death of the chief of the tribe, or even of any one of the clansmen, . . . the lands of all the sept were thrown into *gavel* and redivided.

gavelkind (gav'el-kīnd), *n.* [< Ir. *gabhail-cine*, gavelkind, < *gabhail*, a taking (a tenure), = Gael. *gabhail*, a taking, a lease, farm, = W. *gafael* = Corn. *gavel*, a hold, holding, tenure (see *gavel*1), + Ir. *cine*, a race, tribe, family (cf. W. *cenedl*, a tribe).] 1. Originally, in *old Eng. law*, the tenure of land let out for rent, including in that term money, labor, and provisions, but not military service; also, the land so held. The most important incident of this tenure was that upon the death of the tenant all his sons inherited equal shares; if he left no sons, the daughters; if neither, then all his brothers inherited equal shares. When the feudal system introduced the law of primogeniture, the county of Kent and some other localities were privileged to retain this ancient custom of inheritance.

Lowell, Among my Books, 2d ser., p. 47.

Hence—2. In general use, land in Great Britain or Ireland, or an estate therein, which by custom having the force of law is inheritable by all the sons together, and therefore subject to partition, instead of going exclusively to the eldest. The landholders held their estates by . . . an extraordinary tenure, that of *Irish gavelkind*. On the decease of a proprietor, instead of an equal partition among his children, as in the gavelkind of English law, the chief of the sept . . . made, or was entitled to make, a fresh division of all the lands within his district.

gear-cutter (gēr'kut'ėr), *n.* One who or that which makes toothed or geared wheels for transmitting motion in machinery; specifically, a machine for cutting the teeth of a geared wheel. Gear-cutters are frequently grinding-machines, an emery-wheel being used to cut away the superfluous material between the cogs or teeth, the shape of the emery-wheel determining the shape of the interdental space, and consequently determining the shape of the teeth. Milling-cutters are also much used. Gear-cutting machines usually have the shape of a lathe, the blank being supported on the mandrel, and the cutting-wheel by the tool-rest. The number and pitch of the teeth are regulated by a graduated disk attached to the mandrel, and the cutter is driven by various systems of gearing. Large machines have been made to work as planers, and arranged for every variety of angle and level gearing. Wood-working gear-cutters are rotary cutters (molders), and are used to cut wooden patterns for casting geared wheels. Gear-cutters are also made to cut wheels of epicycloidal form. A gear-cutting attachment is also used with some milling-machines. See *odontograph*.

In *mach.*, the parts collectively by which motion communicated to one part of a machine is transmitted to another; specifically, a train of toothed wheels for transmitting motion. There are two chief sorts of toothed gearing, namely, *spur-gearing* and *beveled gearing*. In the former the teeth are arranged round either the concave or the convex surface of a cylindrical wheel in the direction of radii from the center of the wheel, and are of equal depth throughout. In beveled gearing the teeth are placed upon the exterior periphery of a conical wheel in a direction converging to the apex of the cone, and the depth of the tooth gradually diminishes from the base. The stroke is slow, and the return to the first position is accelerated in order to save time.—**Spiral gearing**, two cylinders set parallel, and having spiral ribs and grooves that mesh or gear together.—**Stepped gearing**, a form of gearing in which each tooth or cog on the face of a wheel is replaced by a series of smaller teeth arranged in steps. It. *gelatina*, < NL. *gelatina*, < L. *gelatus*, pp. of *gelare*, freeze: see *geal*[1], *gelid*, *jelly*.] I. *n.* A concrete animal substance, transparent, hard, and tasteless, which swells without solution in cold water, dissolves in warm water and in acetic acid, and is insoluble in alcohol or ether. Gelatin does not exist as such in the animal tissues, but is formed by the action of boiling water on connective tissues, cartilage, ligaments, and tendons, as well as on skin, horn, fish-scales, etc. The coarser form of gelatin from hoofs, hides, etc., is called *glue*, that from skin and finer membranes is called *size*, and the purest gelatin, from the air-bladders and other membranes of fish, is called *isinglass*. Its leading character is the formation of a tremulous jelly when its solution in boiling water cools. A yellowish-white precipitate is thrown down from a solution of gelatin by tannin, which forms an elastic adhesive mass. Tannin has the same action also on the tissues from which gelatin is made, and this action of tannin is the foundation of the art of tanning leather. Gelatin is nearly related to the proteids. It is regarded as a nutritious food, and much used in preparing soups, jellies, etc.; but animals fed exclusively on it die with the symptoms of starvation. No chemical formula has yet been deduced for gelatin. It contains about 18·3 per cent. of nitrogen, 0.6 per cent. of sulphur, 50 of carbon, 7 of hydrogen, and 23 of oxygen. (See *jelly*.) In all the arts allied to photography, gelatin forms the basis of a great variety of processes. It is at present the usual vehicle for holding the sensitive salts of silver in dry plates, and for holding the sensitive bichromate of potash in all the photo-printing and photo-engraving processes. (See *emulsion*, *carbon process* (under *carbon*), *photolithography*, *heliotype*, and *photography*.) Gelatin is also used to form the copying-pad in a variety of copying processes. See *hectograph*.—**Chromatized gelatin.** See *chromatize*.—**Explosive gelatin**, a very powerful explosive compound made by dissolving guncotton in nitroglycerin heated gently in a water-bath. 3. In *gram.*, a formal distinction in words, apparently founded on and in part expressing differences of sexual character, as male and female, or as male, female, or of neither sex (neuter). In the languages of the Indo-European family the distinction originally is threefold, as masculine, feminine, and neuter (the first including principally male beings, the second female, and the third those of no sex), and appears in nouns, adjectives, and pronouns (except the personal pronouns), although among masculines and feminines are included (on grounds not yet made clear) many words designating things of no sex. In the Semitic languages the genders are only two, masculine and feminine, and the distinction is made also in the second and third persons of verbs. In the majority of languages distinction of gender is altogether wanting. In some tongues differences not of sex are made the ground of formal distinctions also called by some by the name *gender*: thus, that of animate and inanimate objects in American languages; a manifold distinction (of obscure origin) in South African languages, and so on. Some languages, like the modern French, have lost the neuter gender, and have masculine and feminine only; some, like English, have no gender except in a few pronouns, as *he*, *she*, *it*; some, like modern Persian, have no gender whatever.

Although, for example, we had never seen but one rose, we might still have been able to attend to its colour, without thinking of its other properties. When we have proved with respect to the circle that a straight line cannot meet it in more than two points, and when the same thing has been successively proved of the ellipse, the parabola, and the hyperbola, it may be laid down as a universal property of the sections of the cone. . . . It would be difficult to refuse to the proposition arrived at, the name of a *generalization*. . . . But there is not induction. *J. S. Mill*, Logic, III. ii. § 2.

I am not going to attempt a definition of the Anglo-Saxon element in English literature, for *generalizations* are apt to be as dangerous as they are tempting. *Lowell*, Study Windows, p. 246.

3. In *math.*, the process or result of modifying a proposition so as to obtain another having wider subject and predicate, but such that a limitation which, if applied to the new subject, gives the old subject, will reproduce the old predicate when applied to the new. For example, Fermat's theorem is that if ρ is any positive prime number and a any number not divisible by ρ, then the division of $a^{\rho-1}$ by ρ leaves 1 as the remainder. A generalization of this is, that if k is any positive integer, and ϕk the number of numbers as small as k and prime to it, and a is any number relatively prime to k, then the division of $a^{\phi k}$ by k leaves 1 as the remainder; for when k is a prime number, $\phi k = k - 1$, and every number not divisible by k is prime to it. The language of mathematics differs from that of logic in that from every generalization of a proposition the proposition itself is immediately deducible, which is not true in the logicians' sense of the word. The distinction between *generalization* and *extension* in mathematical language is not very clear, but the latter term applies primarily to a conception or function which has received a new and wider definition; also, the modification of a proposition concerning two dimensions so as to make it apply to three is called an *extension*.

Also spelled *generalisation*.

generalize (jen′ẹ-rạl-īz), *v.*; pret. and pp. *generalized*, ppr. *generalizing*. [= D. *generaliseren* = G. *generalisiren* = Dan. *generalisere* = Sw. *generalisera*, < F. *généraliser* = Sp. II. *intrans.* 1. To recognize that two or more objects have a common character; to form a general notion. [Brought into use by Reid.]

We are next to consider the operations of the understanding, by which we are enabled to form general conceptions. These appear to me to have three:—First, The resolving or analyzing a subject into its known attributes, and giving a name to each attribute, which name shall signify that attribute, and nothing more. Secondly, The observing one or more such attributes to be common to many subjects. The first is by philosophers called abstraction; the second may be called *generalizing*; but both are commonly included under the name of abstraction. *Reid*, Intellectual Powers (1785), p. 445.

2. To reason inductively, from particular cases to general rules comprehending those cases.

The reviewer holds that we pass from special experiences to universal truths in virtue of "the inductive propensity the irresistible impulse of the mind to *generalize* ad infinitum." *Whewell*, Hist. Scientific Ideas, x., note.

He continually meets with facts which prove that he had *generalized* on insufficient data. *H. Spencer*, Social Statics, p. 514.

generation (jen-ẹ-rā′shọn), *n.* [< ME. *generacioun* = D. *generatie* = G. Dan. Sw. *generation*, < OF. *generation*, F. *génération* = Pr. *generacio* = Sp. *generacion* = Pg. *geração* = It. *generazione*,

‹ L. *generatio(n-)*, ‹ *generare*, beget, generate: see *generate*.] **1.** The act, process, or function of generating or begetting; procreation; propagation; reproduction; multiplication of kind. Another division is into *sexual* or *gamic generation*, which prevails in all the higher animals and in most others, and *asexual* or *non-sexual* or *agamic generation*. 2. In *theol.*, the communication of the Divine Essence from God the Father to God the Son. The catholic or orthodox Trinitarian doctrine is that God the Son is a distinct person, truly God and of the same essence as the Father, and is therefore existent in his own personality as the Son from all eternity to all eternity, and that the divine act of generation is accordingly itself eternal or without beginning and without end: in opposition to the Arian teaching, that "there was formerly a time when he [Christ] was not, and that before being begotten he was not." The person or hypostasis of God the Son being "the express image [or *impress*, χαρακτήρ] of his [God the Father's] person (ὑπόστασις)" (Heb. i. 3.), the communication of essence is that of a father to a son, and is accordingly *begetting* or *generation*; whereas the communication of the Divine Essence to the Holy Spirit is simply *procession*.

3. A bringing out or forth; evolution, as from a source or cause; production, especially by some natural process or causation: as, the *generation* of sounds.

4. [*cap.*] The first book of the Old Testament. It records the creation of the world, the flood and the ensuing dispersion of races, and a more detailed history of the families of the Hebrew patriarchs Abraham, Isaac, and Jacob. The traditional and still widely prevalent view ascribes the authorship to Moses. Many modern scholars, however, find strong evidences of various periods of authorship, and particularly of two chief sources, the so-called Jehovistic and Elohistic. According to the latter view, the dates of composition fall chiefly within the period of the kingdoms of Judah and Israel (about the eighth century B. C.), the last redaction occurring perhaps after the return from Babylon. What is your *genitive* case plural, William?
Shak., M. W. of W., iv. 1.

II. *n.* In *gram.*, a case in the declension of nouns, adjectives, pronouns, etc., expressing in the widest sense a relation of appurtenance between one thing and another, an adjectival relation of one noun to another, or more specifically source, origin, possession, and the like; in English grammar, the possessive case.

The Latin *genitivus* is a mere blunder, for the Greek word *genikē* could never mean *genitivus*. . . . *Genikē* in Greek had a much wider, a much more philosophical meaning. It meant *casus generalis*, the general case, or rather the case which expresses the genus or kind. This is the real power of the *genitive*. If I say, 'a bird of the water,' 'of the water' defines the genus to which a certain bird belongs; it refers to the genus of water birds. 'Man of the mountains' means a mountaineer. In phrases such as 'son of the father' or 'father of the son,' the *genitives* have the same effect. They predicate something of the son or of the father, and if we distinguished between the sons of the father and the sons of the mother, the *genitives* would mark the class or genus to which the sons respectively belonged. *Max Müller*, Sci. of Lang., iii.

Abbreviated *gen.*

Its two main divisions are the genital and crural branches or nerves.

genius (jē'nius), *n.*; pl. *geniuses*, *genii* (jē'nius-ez, -niī). [< L. *genius*, the tutelar spirit of a person, spirit, inclination, wit, genius, lit. 'inborn nature' (*natura* is from the same root), < *gignere*, OL. *genere*, √ *gen*, beget, produce: see *genus.*] 1. The ruling or predominant spirit of a place, person, or thing; the power, principle, or influence that determines character, conduct, or destiny (supposed by the ancients to be a tutelar divinity, a good spirit, or an evil demon, usually striving with an opposing spirit for the mastery); that which controls, guides, or aids: as, my good *genius* came to the rescue; his evil *genius* enticed him. [In this sense and the following the plural is *genii*.]

Some say, the *Genius* so
Cries, "Come!" to him that instantly must die
Shak, T. and C., iv. 4.

The word *genii* hath by some writers been erroneously adopted for *geniuses*. Each is a plural of the same word *genius*, but in different senses. When *genius* in the singular means a separate spirit or demon, good or bad, the plural is *genii*; when it means mental abilities, or a person eminently possessed of these, the plural is *geniuses*.
G. Campbell, Philos. of Rhetoric, II. iii. 3.

A fairy shield your *Genius* made,
And gave you on your natal day.
Tennyson, Margaret.

2. A disembodied spirit regarded as affecting human beings in certain ways, but not as connected with any one individually.

Bruce, Source of the Nile, II. 26.

3. A type or symbol; a concrete representative, as of an influence or a characteristic; a generic exemplification.

I do remember him at Clement's Inn, like a man made after supper of a cheese-paring: . . . he was the very *genius* of famine. *Shak.*, 2 Hen. IV., iii. 2.

A golden lizard – the very *genius* of desolate stillness—had stopped breathless upon the threshold of one cabin
Bret Harte, Baby Sylvester (Tale of the Argonauts).

4. Prevailing spirit or inclination; distinguishing proclivity, bent, or tendency, as of a person, place, time, institution, etc.; special aptitude or intellectual quality; intrinsic characteristic or qualification: as, a *genius* for poetry, or for diplomacy; the *genius* of Christianity, of the Elizabethan period, of the American Constitution, of the Vatican.

Taking with him his two Sisters, he retired into a Monastery, they into a Nunnery. This does not suit with the *Genius* of an Englishman, who loves not to pull off his Clothes till he goes to bed. *Howell*, Letters, I. iii. 71.

Every age has a kind of universal *genius*, which inclines those that live in it to some particular studies.
Dryden, Essay on Dram. Poesy.

No woman can despise them [ceremonies] with impunity. Their *genius* delights in ceremonies, in forms, in decorating life with manners, with proprieties, order, and grace. *Emerson*, Woman.

It is this tendency on the part of the collective speakers of a language to approve or reject a proposed change according to its conformity with their already subsisting usages that we are accustomed to call by the fanciful name "the *genius* of a language."
Whitney, Encyc. Brit., XVIII. 776.

Human nature has a much greater *genius* for sameness than for originality. *Lowell*, Study Windows, p. 63.

5. Exalted mental power distinguished by instinctive aptitude, and independent of tuition; phenomenal capability, derived from inspiration or exaltation, for intellectual creation or expression; that constitution of mind or perfection of faculties which enables a person to excel others in mental perception, comprehension, discrimination, and expression, especially in literature, art, and science.

By *genius* I would understand that power, or rather those powers of the mind, which are capable of penetrating into all things within our reach and knowledge, and of distinguishing their essential differences.
Fielding, Tom Jones, ix. 1.

Genius always imports something inventive or creative.
H. Blair, Rhetoric, iii.

We owe to *genius* always the same debt, of lifting the curtain from the common, and showing us that divinities are sitting disguised in the seeming gang of gypsies and peddlers. *Emerson*, Works and Days.

Lowell, Among my Books, 1st ser., p. 356.

6. A person having such mental power; a person of general or special intellectual faculties developed in a phenomenal degree. [In this sense the plural is *geniuses*. It was formerly also *genii*.]

Genius loci. [L.] The presiding divinity of a place; hence, the pervading spirit of a place or an institution, as of a college. See def. 1. = **Syn. 5.** *Abilities, Gifts, Talents, Parts, Aptitude, Faculty, Capacity, Genius, Ingenuity, Cleverness*, all indicate special or excellent power for doing work that is more or less intellectual. *Abilities* is the most general and common word for intellectual powers of the active sort, intellectual competence to do effective work; *abilities* are always either acquired or developed. (See *ability.*) *Gifts* are strictly endowments, or abilities regarded as conferred by the Creator. (See *acquirement.*) *Talents* comes to the same idea, its Biblical origin (Mat. xxv. 14–30) making the powers seem primarily intrusted to one for use, or at least given like money. *Parts* is regaining its former popularity and dignity, which it lost for a time; in the last century it stood for *talents* or *gifts*, excellent or superior endowments: as, he is a man of *parts*, or he is a man of good natural *parts*, the latter perhaps implying a failure to develop one's *gifts*. *Aptitude* is either natural bias or special fitness or skill; it may be native talent or disciplined ability. *Faculty* is cultivated aptitude, a highly trained power of doing something. The distinction between *a faculty for* and *the faculty of* should be noticed, the former being the kind of *faculty* now under consideration and the latter a bodily *faculty*, as the *faculty* of speech, hearing, etc. *Capacity* is receptive power: as, *capacity* to learn; it is a power of acquiring. "It is most remarkable in the different degrees of facility with which different men acquire a language." *Sir J. Mackintosh.* (See *ability.*) *Genius* is extraordinarily developed faculty, in many directions or in one; it is especially the creative power of original conceptions and combinations; it belongs with *talents* or *gifts* in seeming primarily bestowed, not acquired, and it includes *capacity* and *aptitude* in their highest forms. *Ingenuity* is lower than *genius*, in seeming cultivated, not bestowed, in seeming less superhuman or phenomenal, and often in serving less exalted purposes: as, the *ingenuity* of the mechanic, of the rhetorician, of the sophist. *Cleverness* is still lower, being a sort of mental dexterity, which is evinced in facility in learning or felicity in expression; it may be a merely manual dexterity. (See quotation from Coleridge under *cleverness*.) It should be noticed that all these words, except *parts*, may be used in the singular for skill or power or natural bent in some particular direction: as, *ability* in debate, a *talent* for drawing, the *gift* of conversation, an *aptitude* for scientific research, *ingenuity* in argument, etc. See *wisdom* and *astute*.

As we advance in life, we learn the limits of our *abilities*. *Froude*, Short Studies on Great Subjects, II 313.

Conversation in its better part
May be esteem'd a *gift*, and not an art.
Cowper, Conversation, l. 4

The man of *talents* possesses them like so many tools, does his job with them, and there an end; but the man of *genius* is possessed by it, and it makes him into a book or a life according to its whim.
Lowell, Fireside Travels, p. 64.

All my endeavors to distinguish myself were only for want of a great title and fortune, that I might be used like a lord by those who have an opinion of my *parts*; whether

right or wrong is no great matter. And so the reputation of wit and great learning does the office of a riband or a coach and six. *Swift*, To Bolingbroke.

That his style was no easy acquisition (though, of course, the *aptitude* was innate), he [Dryden] himself tells us. *Lowell*, Among my Books, 1st ser., p. 30.

For, above all things, he had what we Yankees call *faculty*—the knack of doing everything. *G. W. Curtis*, Int. to Cecil Dreeme, p. 12.

As the sum and crown of what is to be done for technical education, I look to the provision of a machinery for winnowing out the *capacities* and giving them scope. *Huxley*, Tech Education

Sir Isaac Newton and Milton were equally men of *Genius*. Sir Robert Walpole and Lord Godolphin were ministers of great *abilities*, though they did not possess either the brilliant *talents* of Bolingbroke or the commanding *genius* of Chatham. *Sir J. Mackintosh.*

There is also another species of *genius* we call *ingenuity*, or the inventive *faculty*, which frequently accompanies or takes the place of the higher flights of *genius*, that meantime lies idle, or fallow, to recruit its powers. *Jon Ller*, Essay on Samuel Foote.

Patience and tenacity of purpose are worth more than twice their weight of *cleverness*. *Huxley*, Critiques and Addresses, p. 58.

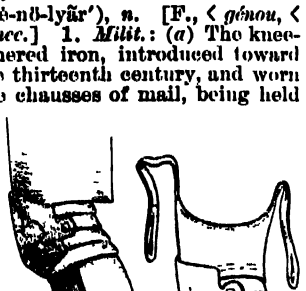
genoblastic (jen-ō-blas'tik), *a.* [< *genoblast* + *-ic.*] Germinating as a result of union of sexual elements; gamogenetic; pertaining to a genoblast. See the extract.



This author [E. Van Beneden] . . . suggests that the peripheral pronucleus is probably partially formed of spermatic substance, that the central pronucleus is female, and that the segmentation nucleus is a compound body resulting from the union of these two, and is probably, therefore, bisexual. This statement includes all the basal facts of the *genoblastic* theory. *A. Hyatt*, Amer. Jour. Sci., 3d ser., XXXI. 336.

There are about 180 species, found in the mountains and temperate regions of the northern hemisphere, throughout the Andes, and very sparingly in Australia and New Zealand; over 40 are natives of the United States. The flowers are usually blue, but are sometimes yellow, white, or (in the Andes) red. All the species are characterized by an extremely bitter principle, without astringency or acridity, on which account the roots of various species, especially of the European *G. lutea*, are used in medicine as a tonic. See *gentian*.—**Gentiana blue**. Same as *spirit-blue*.

Primarily, a *Gentile*, or the word of which it was a translation, signified to the Jews one not a Jew, but later one who was neither Jew nor Christian, or, from the Roman standpoint, one not a Roman. *Pagan* and *heathen* are primarily the same in meaning; but *pagan* is sometimes distinctively applied to those nations that, although worshiping false gods, are more cultivated, as the Greeks and Romans, and *heathen* to uncivilized idolaters, as the tribes of Africa. The gentle (or **gentler**) **sex**, women collectively; womankind: opposed to *the sterner sex*.—**Syn. 3** and **4**. *Gentle, Meek, Bland, Soft, Tame, Mild*; placid, dovelike, quiet, peaceful, pacific, moderate, clement, lenient, merciful, kind, indulgent; tractable, docile. Of the first six words, *meek* applies only to personal character and behavior; it is wholly good in the Bible, and now indicates a defect of character only occasionally by hyperbole. The others may be either physical or moral. The meaning of *bland* is founded upon the pleasant feeling of warm breezes, etc.; it suggests a peculiarly soothing impression, as a *bland* demeanor, or an artful endeavor to make such an impression. *Soft* suggests that which yields somewhat upon physical contact, and hence anything not making firm resistance or striking hard. As to animals, *gentle* refers to nature, being opposed to *rough* or *fierce*, while *tame* is opposed to *wild*, and refers to familiarity with man: as, a *tame* duck. *Tame* is used in a bad sense of spirit and of intellectual productions: as, a *tame* spirit; some very *tame* remarks. *Mild* goes further than *gentle* in expressing softness of nature; it is chiefly a word of nature or character, while *gentle* is chiefly a word of action. *Mild* is sometimes opposed to *acrid, tart*, etc.

The words derived from the L. and Gr. √ *gen*, γεν, are very numerous: from L. are *genus, gender, n., gender, v., engender, general, generate, generic, generous, congener*, etc., *genius, genial*[1], *congenial, ingenious, engine, gin*[4], etc., *gens, gentile, gentle, genteel, gent*[1], *genty, jaunty*, etc., *genital, geniture, genuine, ingenuous, indigenous, progeny, progenitor*, etc.; from Gr. are *genealogy, genesis, biogenesis*, etc., *genetic, heterogeneous, homogeneous, endogen, exogen, hydrogen, oxygen*, etc., *gonocalyx, gonophore*, etc., *cosmogony, geogony, theogony*, etc., and many other words in *-gen, -genic, -genous, -geny, -gony*, etc.] A kind; a sort; a class. Technically — (*a*) In *logic*, that which can be predicated of things differing in species; a class having other classes under it.

We collect things under comprehensive ideas, with names annexed to them, into *genera* and species, i. e., into "kinds" and "sorts."
Locke, Human Understanding, II. xxxii. 6.

(*b*) In *zoöl.* and *bot.*, a classificatory group ranking next above the species, containing a group of species (sometimes a single species) possessing certain structural characters different from those of any others. The value assigned to a genus is wholly arbitrary — that is, it is entirely a matter of opinion or current usage what characters shall be considered generic and thus constitute a genus; and genera are constantly modified and shifted by specialists, the tendency being mostly to restriction of genera, with the consequent multiplication of their number, and the coinage of new generic names. A genus has no natural, much less necessary, definition, its meaning being at best a matter of expert opinion; and the same is true of the species, family, order, class, etc. A genus of the animal kingdom in the time of Linnæus and other early naturalists was a group of species approximately equivalent to a modern family, sometimes even to an order. Probably upward of 100,000 generic names of as many supposed genera have been coined or used in zoölogy; those in current use at present are estimated at about 60,000, or an average of about (rather more than) one genus for every five species in the animal kingdom. In botany the genera are less restricted and average a much larger number of species, the 9,000 phanerogamic genera, for example, including 100,000 species. The tenable name of any genus is that which has priority of publication, if it has been properly published and characterized, and is not the same as the prior name of some other genus. The names of the genus and the species together form the scientific name of an animal or a plant. In writing the technical name of any animal or plant, the generic term always precedes the specific, and begins with a capital letter: as, *Musca domestica*, the house-fly, where *Musca* is the genus, and *domestica* differentiates the species. Genera are often subdivided into lesser groups called subgenera. (See *subgenus*.) A group of genera constitutes a family or subfamily. The name of a genus as such has properly no plural. If a genus name, as for example *Ada*, is pluralized, as *Adæ*, it means, not two or more genera named *Ada*, but either (*a*) all the species of *Ada*, or (*b*) some supergeneric group of which *Ada* is the type. The former usage is loose, or somewhat cant; the latter is frequent and regular in zoölogy. A genus name is always supposed to be Latin (though its derivation is in the great majority of cases from the Greek), and its plural, if used, is in Latin form; but when it is also Anglicized an English plural is used: as, the *chinchillas*, the animals of the genus *Chinchilla*.

Genera are most closely allied groups of animals, differing . . . simply in the ultimate structural peculiarities of some of their parts; and this is, I believe, the best definition which can be given of *genera*.
Agassiz, Essay on Classification, ii. § 5.

(*c*) In *old music*, a formula or method of dividing the tetrachord. Three genera were distinguished: the diatonic, in which whole steps or "tones" were used; the chromatic, in which only half-steps or semitones were used; and the enharmonic, in which intervals less than a half-step were used. — **Highest, supreme,** or **most general genus,** in *logic*, a genus which has no higher or supravenient genus. — **Homonymous genus,** a genus to which the different species under it do not belong in the same sense; an equivocal genus. — **Subaltern** or **middle genus,** a genus which is at the same time a species of a higher genus.

Simple *political geography* is the study of the present condition of things in that respect; *historical geography* investigates and records the changes in the governmental control of territory which have occurred from time to time. Almost every branch of physical and natural science is, or may be, called upon to throw light on the problems which present themselves to the geologist. Closely connected with geology, and indeed almost inseparable from it, is paleontology, or the study of ancient forms of life, since the rocks are found on examination to contain in many places remains of plants or animals, sometimes closely resembling, and often very different from, any now living on the earth. It is almost exclusively the order of succession of forms of life thus found which gives the geologist the means of making out a chronological arrangement for the different stratified formations. Physical geography, or physiography, is the necessary introduction to geology, and forms the link which unites the work of the geographer to that of the geologist. One when direct and one when retrograde.
Dryden, Pal. and Arc., ii. 614.

geomantically (jē-ọ̄-man'ti-kạl-i), *adv.* In a geomantic manner; by means of geomancy.

geomanty (jē'ọ̄-man-ti), *n.* [< ML. *geomantia*: see *geomancy*.] Same as *geomancy*. *E. D.*

geometer (jẹ̄-om'e-tėr), *n.* [= F. *géomètre* = Sp. *geómetra* = Pg. It. *geometra* = G. *geometer*, < L. *geometres*, LL. also *geometra*, < Gr. γεωμέτρης, a land-measurer, geometer, < γῆ, the earth, land, + μέτρον, a measure. In earlier form *geometrian*.] **1.** One skilled in geometry; a geometrician; hence, a mathematician in general.

All who are ever so little of *geometers* will remember the time when their notions of an angle, as a magnitude, were as vague as, perhaps more so than, those of a moral quality. *Jevons*, Pol. Econ., p. 10.
